Adobe InDesign CS3 Scripting Tutorial

Introduction

Scripting is the most powerful feature in Adobe® InDesign® CS3. No other feature can save you as much time, trouble, and money as scripting.

This document is for every InDesign user. If you never created a script before, we show you how to get started. If you wrote scripts for other applications, we show you how to apply your knowledge to InDesign scripting.

The document also covers how to install and run an InDesign script and describes what InDesign scripting can and cannot do. We discuss the software you need to start writing your own scripts.

After you learn the basics of InDesign scripting in this tutorial, you can move on to *Adobe InDesign CS3 Scripting Guide*, which explores scripting in more depth. *Adobe InDesign CS3 Scripting Guide* contains hundreds of tutorial scripts covering topics like text formatting, finding and changing text, associating scripts with menu items, drawing objects on a page, and exporting documents.

Getting Started

Almost anything you can do with the user interface; you can do with a script. You can draw frames, enter and format text, place graphics, and print or export the pages of the document. Any action that can change a document or its contents can be scripted. There even are a few things you can do in scripting that you cannot do using the user interface.

Scripts can create menus, add menu items, create and display dialog boxes and panels, and respond to user-interface selections. Scripts can read and write text files, parse XML data, and communicate with other applications.

Scripts can do everything from very small tasks (like setting a tab stop at the location of the text cursor) to providing complete features (InDesign's XHTML export feature is provided by a script). You can start with simple scripts that do only one thing and move on to scripts that automate your entire publishing workflow.

Most of the things scripting cannot do—like setting up a workspace or defining a set of keyboard shortcuts—are things that have to do with the user interface. In addition, scripts cannot add new types of objects to an InDesign document or add new, fundamental capabilities to the program, like a new text-composition engine. For that type of extensibility, you must use the InDesign Software Development Kit (SDK), which shows you to write compiled plug-ins using C++.

We tend to think of scripting in terms of long, repetitive tasks, like laying out a phone book. It also is good for things like the following:

- Automating the myriad, small, annoying tasks you face every day.
- Customizing InDesign to match your work habits and layouts.
- Achieving creative effects that would be difficult or impossible to attain by other means.

Installing Scripts

Installing an InDesign script is easy: put the script file in the Scripts Panel folder inside the Scripts folder in your InDesign application folder. (Create the Scripts folder if it does not already exist.)

Alternately, put the script inside the Scripts Panel folder in your user-preferences folder. Your user-preferences folder is at

Mac OS: ~/Library/Preferences/Adobe InDesign/Version 5.0/Scripts

Windows XP: ~\Documents and Settings*user_name*\Application Data\Adobe
 \InDesign\Version 5.0\Scripts

where ~ is your system volume and *user_name* is your user name.

Once the script is in the folder, it appears on the Scripts panel inside InDesign. To display the panel, choose Window > Automation > Scripts.

You also can put aliases/shortcuts to scripts (or to folders containing scripts) in the Scripts Panel folder, and they will appear in the Scripts panel.

To run a specific script when InDesign starts, put the script inside a folder named "Startup Scripts" inside the Scripts folder (create this folder if it does not already exist).

Running a Script

To run a script, display the Scripts panel (choose Window > Automation > Scripts), then double-click the script name in the Scripts panel. Many scripts display user-interface items (like dialog boxes or panels) and display alerts if necessary.

Using the Scripts Panel

The InDesign Scripts panel is the easiest and best way to run most InDesign scripts. If the panel is not already visible, you can display it by choosing Window > Automation > Scripts.

Scripts run from the Scripts panel run faster than scripts run from the Finder (Mac OS®) or Explorer (Windows®). To view the script actions as they execute, choose Enable Redraw from the Scripts panel menu.

The Scripts panel can run compiled or uncompiled AppleScripts (files with the file extension .spt, .as, or .applescript), JavaScripts (files with the file extension .js or .jsx), VBScripts (files with the extension .vbs), or executable programs from the Scripts panel.

To edit a script shown in the Scripts panel, hold down Option (Mac OS) or Alt (Windows) key and double-click the script's name. This opens the script in the editor you defined for the script file type.

To open the folder containing a script shown in the Scripts panel, hold down the Command (Mac OS) or Ctrl-Shift (Windows) keys and double-click the script's name. Alternately, choose Reveal in Finder (Mac OS) or Reveal in Explorer (Windows) from the Scripts panel menu. The folder containing the script opens in the Finder (Mac OS) or Explorer (Windows).

Scripts run as a series of actions, which means you can undo the changes the script made to a document by choosing Undo from the Edit menu. This can help you troubleshoot a script, as you can step backward through each change.

To add a keyboard shortcut for a script, choose Edit > Keyboard Shortcuts, select an editable shortcut set from the Set menu, then choose Product Area > Scripts. A list of the scripts in your Scripts panel appears. Select a script and assign a keyboard shortcut as you would for any other InDesign feature.

About Scripting Languages

The language you use to write scripts depends on the scripting system of your platform: AppleScript for Mac OS, VBScript for Windows, or JavaScript for either platform. Although the scripting languages differ, the ways they work with InDesign are very similar.

Each sample script in this document is shown in all three scripting languages. Translating a script from one language to another is fairly easy.

JavaScript

InDesign supports JavaScript for cross-platform scripting in both Mac OS and Windows. InDesign's JavaScript support is based on an Adobe implementation of JavaScript known as ExtendScript. The ExtendScript interpreter conforms to the current, ECMA 262 standard for JavaScript. All language features of JavaScript 1.5 are supported. Adobe Illustrator®, Adobe Photoshop®, and other Adobe Creative Suite® products also use the ExtendScript JavaScript interpreter.

While you can write scripts using other versions of JavaScript, like Microsoft® JScript (in Windows) or Late Night Software's OSA JavaScript (on the Mac OS), the terms you use in those languages are not the same as the terms you use in ExtendScript. ExtendScript examples do not work in other JavaScript versions.

Note: Because ExtendScript tools and features are used in several Adobe products, we consolidated all ExtendScript documentation. To learn more about JavaScript utilities like the ScriptUI user-interface module and the ExtendScript Toolkit (a JavaScript development environment and object-model inspector), see *Creative Suite 3 JavaScript Tools Guide*.

Mac OS

To use InDesign scripting on Mac OS, you can use either JavaScript or AppleScript. To write AppleScripts, you must have AppleScript version 1.6 or higher and an AppleScript script editor. AppleScript comes with all Apple® systems, and it can be downloaded free from the Apple Web site. The Apple Script Editor is included with the Mac OS; third-party script editors, like Script Debugger (from Late Night Software, <http://www.latenightsw.com>) also are available.

Windows

To use InDesign scripting in Windows, you can use either JavaScript or some version of Microsoft Visual Basic, like VBScript.

The Visual Basic tutorial scripts are written in VBScript. We chose VBScript because no added software is required to run or edit VBScripts; you can edit them with any text editor (like Notepad) and run them using the InDesign Scripts panel.

Other versions of Visual Basic include Visual Basic 5 Control Creation Edition (CCE), Visual Basic 6, Visual Basic .NET, and Visual Basic 2005 Express Edition. Versions of Visual Basic prior to Visual Basic .NET work well with InDesign scripting. Visual Basic .NET and newer versions work less well, because they lack the `variant` data type, which is used extensively in InDesign scripting.

Many applications contain Visual Basic for Applications (VBA), like Microsoft Word, Microsoft Excel, Microsoft Visio, or AutoCAD. Although you can use VBA to create InDesign scripts, InDesign does not include VBA.

To use VBScript or Visual Basic for InDesign scripting in Windows XP, you must install InDesign from a user account that has Administrator privileges. After you complete the installation, any user can run InDesign scripts, and any user can add scripts to the InDesign Scripts panel.

Which Scripting Language should you use?

If you have written scripts before, use whatever language you know. If you have never written scripts before or if you need to make your scripts work on both the Mac OS and Windows versions of InDesign, use JavaScript. If you need to communicate with other, non-Adobe applications on your system, use the appropriate, platform standard language (AppleScript on Mac OS or VBScript in Windows).

We cannot fully document the language features of AppleScript, JavaScript, or VBScript, so you may need documentation for any or all those scripting languages.

Note: You also can use almost any other programming language (like Python or C#) that can connect to the platform standard automation system; that is beyond the scope of this document.

How to use the Scripts in this Document

To use any script from this document, either open the tutorial script file (the filename is given before each script) or follow these steps:

1. Copy the script from this Adobe PDF document and paste it into your script editor, such as the ExtendScript Toolkit (for JavaScript examples), the Apple Script Editor (for AppleScript examples), or a text editor like Notepad (for VBScript examples).

2. Save the script as a plain text file in the Scripts Panel folder (see “Installing Scripts” on page 4), using the appropriate file extension:

AppleScript: `.applescript`

JavaScript: `.jsx`

VBScript: `.vbs`

3. Choose Windows > Automation > Scripts, to display the Scripts panel.
4. Double-click the script name in the Scripts panel, to run the script.

Note: If you are entering the JavaScript examples, it is very important to use the same capitalization shown in the example. JavaScript is case-sensitive, and the scripts will fail if they do not use the capitalization shown. The AppleScript and VBScript examples are not case-sensitive.

Note: If you are copying and pasting scripts from this document, be aware that line breaks caused by the layout of the document can cause errors in your script. As it can be very difficult to find such errors, we recommend that you use the scripts in the zip archive.

Your First InDesign Script

Next, we will create an InDesign script that creates a new document, adds a text frame, and enters text in the text frame. This demonstrates how to do the following:

- Establish communication with InDesign.
- Create a new document.
- Create a text frame on a specific page.
- Add text to a text frame.

AppleScript

Start the Script Editor application (you can find it in your Applications folder, inside the AppleScript folder). Enter the following script (or open the `HelloWorld.applescript` tutorial script):

```
tell application "Adobe InDesign CS3"
  set myDocument to make document
  tell page 1 of myDocument
    set myTextFrame to make text frame
    set geometric bounds of myTextFrame to {"6p", "6p", "24p", "24p"}
    set contents of myTextFrame to "Hello World!"
  end tell
end tell
```

Save the script as text with the file extension `.applescript` to the Scripts Panel folder (see “Installing Scripts” on page 4). To run the script, double-click the script name in the Scripts panel or click the Run button in the Script Editor window.

JavaScript

Start the ExtendScript Toolkit (or a text editor). Enter the following script (or open the `HelloWorld.jsx` tutorial script):

```
var myDocument = app.documents.add();
var myTextFrame = myDocument.pages.item(0).textFrames.add();
myTextFrame.geometricBounds = ["6p", "6p", "24p", "24p"];
myTextFrame.contents = "Hello World!";
```

Save the script as a plain-text file with the `.jsx` file extension to the Scripts Panel folder (see “Installing Scripts” on page 4). To run the script, double-click the script name in the Scripts panel, or select InDesign from the application target pop-up menu in the ExtendScript Toolkit and then click the Run button).

VBScript

Start a text editor (e.g., Notepad) and enter the following script (or open the `HelloWorld.vbs` tutorial script):

```
Set myInDesign = CreateObject("InDesign.Application.CS3")
Set myDocument = myInDesign.Documents.Add
Set myTextFrame = myDocument.Pages.Item(1).TextFrames.Add
myTextFrame.GeometricBounds = Array("6p", "6p", "24p", "24p")
myTextFrame.Contents = "Hello World!"
```

Save the script as a text file with the `.vbs` file extension to the Scripts Panel folder (see “Installing Scripts” on page 4). To run the script, double-click the script name in the Scripts panel.

Walking through the Script

Examining the script presented above, here is a step-by-step analysis of what the script does (in each scripting language):

1. Establish communication with the InDesign application object:

AppleScript: `tell application "Adobe InDesign CS3"`

JavaScript: Refer to the application as `app`.

VBScript: `Set myInDesign = CreateObject("InDesign.Application.CS3")`

2. Create a new document and a reference to the document:

AppleScript: `Set myDocument to make document`

JavaScript: `Var myDocument = app.documents.add();`

VBScript: `Set myDocument = myInDesign.Documents.Add`

3. Create a new text frame on the first page and a create a reference to the text frame.:

AppleScript: `tell page 1 of myDocument
set myTextFrame to make text frame`

JavaScript: `var myTextFrame = myDocument.pages.item(0).textFrames.add();`

VBScript: `Set myTextFrame = myDocument.Pages.Item(1).TextFrames.Add`

4. Set the geometric bounds (the location of the top, left, bottom, and right edges) of the text frame. In this step, the script uses measurement overrides ("p" for picas) to ensure the text frame is the correct size, regardless of your default measurement units. The locations are provided as a list, or array, of values; each scripting language has a slightly different way of creating an array. For more on array variables, see "Array Variables" on page 11.

AppleScript: `set geometric bounds of myTextFrame to {"6p", "6p", "24p", "24p"}`

JavaScript: `myTextFrame.geometricBounds = ["6p", "6p", "24p", "24p"];`

VBScript: `myTextFrame.GeometricBounds = Array("6p", "6p", "24p", "24p")`

5. Add text to the text frame by setting the contents property to a string.:

AppleScript: `set contents of myTextFrame to "Hello World!"`

JavaScript: `myTextFrame.contents = "Hello World!";`

VBScript: `myTextFrame.Contents = "Hello World!"`

Scripting and the InDesign Object Model

This section discusses the terminology of scripting languages in general and InDesign scripting in particular.

Scripting Terminology

This section discusses common scripting terms and concepts.

Comments

Comments give you a way to add descriptive text to a script. The scripting system ignores comments as the script executes; this prevents comments from producing errors when you run your script. Comments are useful to document the operation of a script (for yourself or someone else). In this document, we use comments in the tutorial scripts.

To include a comment in an AppleScript, type `--` to the left of your comment or surround the comment with `(* and *)`. In VBScript, type `Rem` (for “remark”) or `'` (a single straight quote) to the left of the comment. Type the comment marker at the beginning of a line, to make the entire line a comment. In JavaScript, type `//` to the left of the comment, or surround the comment with `/* and */`. For example:

```
AppleScript:  --this is a comment
               * and so is this *)

JavaScript:   // this is a comment
               /* and so is this */

VBScript:    Rem this is a comment
              ' and so is this
```

Values

The point size of a character of text, the location of a text frame on a page, and the color of stroke of a rectangle are examples of *values* used in InDesign scripting. Values are the data your scripts use to do their work.

The *type* of a value defines what sort of data the value contains. For example, the value type of the contents of a word is a text string, and the value type of the leading of a paragraph is a number. Usually, the values used in scripts are numbers or text. The following table explains the value types most commonly used in InDesign scripting:

Value Type	What it is	Example
Boolean	Logical True or False.	True
Integer	Whole numbers (no decimal points). Integers can be positive or negative. In VBScript, you can use the long data type for integers. In AppleScript, you also can use the fixed or long data types for both integers and real numbers.	14
Double (VBScript), fixed or real (AppleScript), floating point (JavaScript)	A high-precision number that can contain a decimal point.	13.9972
String	A series of text characters. Strings appear inside (straight) quotation marks.	"I am a string"

Value Type	What it is	Example
Array (VBScript, JavaScript) or list (AppleScript)	A list of values (the values can be any type).	<p>AppleScript: {"0p0", "0p0", "16p4", "20p6"}</p> <p>VBScript: Array("0p0", "0p0", "16p4", "20p6")</p> <p>JavaScript: ["0p0", "0p0", "16p4", "20p6"]</p>

Converting Values from one Type to Another

All scripting languages supported by InDesign provide ways to convert variable values from one type to another. The most common conversions involve converting numbers to strings (so you can enter them in text or display them in dialog boxes) or converting strings to numbers (so you can use them to set a point size or page location). See the examples below.

AppleScript:

```
--To convert from a number to a string:
set myNumber to 2
set myString to (myNumber as string)
--To convert from a string to a number:
set myString to "2"
set myNumber to (myString as integer)
--if your string contains a decimal value, use "as real" rather than "as integer"
```

JavaScript:

```
//To convert from a number to a string:
myNumber = 2;
myString = myNumber + "";
//To convert from a string to an integer:
myString = "2";
myNumber = parseInt(myString);
//If your string contains a decimal value, use "parseFloat" rather than
"parseInt":
myNumber = parseFloat(myString);
//You can also convert strings to numbers using the following:
myNumber = +myString;
```

VBScript:

```
Rem To convert from a number to a string:
myNumber = 2
myString = cstr(myNumber)
Rem To convert from a string to an integer:
myString = "2"
myNumber = cInt(myString)
Rem If your string contains a decimal value, use "cDbl" rather than "cInt":
myNumber = cDbl(myString)
```

Variables

A *variable* is a container for a value. They are called “variables” because the values they contain might change. A variable might hold a number, a string of text, or a reference to an InDesign object. Variables have names, and you refer to a variable by its name. To put a value into a variable, you *assign* the data to the variable.

In our first sample script, above, we used the variables `myDocument` and `myTextFrame` to avoid having to provide the full specification of the object (such as `text frame 1 of page 1 of document 1` or `app.documents.item(0).pages.item(0).textFrames.item(0)`) every time we refer to the object.

In all the sample and tutorial scripts that come with InDesign, all variables start with `my`. This way, you can easily differentiate variables we created in a script from the scripting language terms.

Assigning a Value to a Variable

Assigning values or strings to variables is fairly simple, as shown in the following table:

Language	Examples of Assigning a Value to a Variable
AppleScript	<pre>set myNumber to 10 set myString to "Hello, World!" set myTextFrame to make text frame at page 1 of myDocument</pre>
JavaScript	<pre>var myNumber = 10; var myString = "Hello, World!"; var myTextFrame = myDocument.pages.item(0).textFrames.add();</pre>
VBScript	<pre>myNumber = 10 myString = "Hello, World!" Set myTextFrame = myDocument.Pages.Item(1).TextFrames.Add</pre>

Note: In JavaScript, all variables not preceded by `var` are considered global by default; that is, they are not bound to a specific function. `var` is not required, but we recommend you use `var` in any script with more than one function. In AppleScript and VBScript, variables are local unless specifically defined as global variables. This means the variables do not persist outside the function in which they are created.

Try to use descriptive names for your variables, like `firstPage` or `corporateLogo`, rather than `x` or `c`. This makes your script easier to read. Longer names do not affect the execution speed of the script.

Variable names must be one word, but you can use internal capitalization (`myFirstPage`) or underscore characters (`my_first_page`) to create more readable names. Variable names cannot begin with a number, and they cannot contain punctuation or quotation marks.

Array Variables

AppleScript, JavaScript, and VBScript support *arrays*, which is a variable type that is a list of values. In AppleScript, an array is called a *list*. Examples of defining arrays are shown below:

Language	Examples of Defining Arrays
AppleScript	set myArray to {1, 2, 3, 4}
JavaScript	myArray = [1, 2, 3, 4];
VBScript	myArray = Array(1, 2, 3, 4) Rem In Visual Basic.NET: myArray = New Double (1, 2, 3, 4)

To refer to an item in an array, refer to the item by its index in the array. The first item in an array in VBScript and JavaScript is item 0; in AppleScript, item 1. Examples of referring to items in an array are shown below:

Language	Examples of Referring to an Item in an Array
AppleScript	set myFirstArrayItem to item 1 of myArray
JavaScript	var myFirstArrayItem = myArray[0];
VBScript	myFirstArrayItem = myArray(0)

Note: The Visual Basic `OptionBase` statement can be used to set the first item of an array to item 1. In the examples in this document, the first item in an array is item 0, not item 1, because that is the default. If you set `OptionBase` to 1, you must adjust all array references in the sample scripts accordingly.

Arrays can include other arrays, as shown in the following table:

Language	Examples
AppleScript	set myArray to {{0, 0}, {72, 72}}
VBScript	myArray = Array(Array(0,0), Array(72, 72)) Rem In Visual Basic.NET: myArray = New Array(New Double(0,0), NewDouble (0,0))
JavaScript	var myArray = [[0,0], [72,72]];

Finding the Value Type of a Variable

Sometimes, your scripts must make decisions based on the value type of an object. For example, if you are working on a script that operates on a text selection, you might want that script to stop if the type of the selection is a page item. All the scripting languages allow you to determine the type of a variable.

AppleScript:

```
-- Given a variable of unknown type, "myMysteryVariable"...
set myType to class of myMysteryVariable
--myType will be an AppleScript type (e.g., rectangle)
```

JavaScript:

```
//Given a variable of unknown type, "myMysteryVariable"...
myType = myMysteryVariable.constructor.name;
//myType will be a string corresponding to the JavaScript type (e.g., "Rectangle")
```

VBScript:

```
Rem Given a variable of unknown type, "myMysteryVariable"...  
myType = TypeName(myMysteryVariable)  
Rem myType will be a string corresponding to the variable type (e.g., "Rectangle")
```

Operators

Operators use variables or values to perform calculations (addition, subtraction, multiplication, and division) and return a value. For example:

```
MyWidth/2
```

This returns a value equal to half of the content of the variable `myWidth`.

You also can use operators to perform comparisons: equal to (`=`), not equal to (`<>`), greater than (`>`), or less than (`<`). For example:

```
MyWidth > myHeight
```

This returns `true` (or 1) if `myWidth` is greater than `myHeight`; otherwise, `false` (0).

All the scripting languages provide additional utility operators. In AppleScript and VBScript, the ampersand (`&`) concatenates (or joins) two strings:

```
"Pride " & "and Prejudice"
```

This returns the following string:

```
"Pride and Prejudice"
```

In JavaScript, use the plus sign (`+`) to join the two strings:

```
"Pride " + "and Prejudice"  
//returns the string: "Pride and Prejudice"
```

Conditional Statements

"If the selected object is a rectangle, set its stroke weight to 12 points." This is an example of a *conditional statement*. Conditional statements make decisions; they give your scripts a way to evaluate something (like the color of the selected object, the number of pages in the publication, or the date) and act based on the result. Conditional statements almost always start with `if`.

Note: Conditional statements often make logical comparisons. In AppleScript and VBScript, use the equals sign (`=`) to compare objects. In JavaScript, the equals sign assigns a value to a variable; to compare objects, use a double equals sign (`==`).

Control Structures

If you could talk to InDesign, you might say, "Repeat the following procedure 20 times." In scripting terms, this is a *control structure*. Control structures provide repetitive processes, or *loops*. The idea of a loop is to repeat an action over and over, with or without changes between instances (or *iterations*) of the loop, until a specific condition is met. Control structures usually start with `repeat` (in AppleScript) or `for` (in JavaScript and VBScript).

Functions and Handlers

Functions (in VBScript or JavaScript) or *handlers* (in AppleScript) are scripting modules you can refer to within your script. Typically, you send a value or series of values to a function (or handler) and get back some other value or values. The code used in functions and handlers is simply a convenience to avoid having to type the same lines of code repeatedly in your script.

In AppleScript, handlers start with `on`. In JavaScript and VBScript, functions start with `function`.

Understanding the InDesign Object Model

When you think about InDesign and InDesign documents, you probably organize the program and its components in your mind. You know paragraphs are contained by text frames which, in turn, appear on a page. A page is a part of a spread, and one or more spreads make up a document. Documents contain colors, styles, layers, and master spreads. As you think about the layouts you create, you intuitively understand there is an order to them.

InDesign “thinks” about the contents of a document in the same way. A document contains pages, which contain page items (text frames, rectangles, ellipses, and so on). Text frames contain characters, words, paragraphs, and anchored frames; graphics frames contain images, EPS files, or PDF files; and groups contain other page items. The things we mention here are the *objects* that make up an InDesign publication, and they are what we work with when we write InDesign scripts.

Objects in your publication are arranged in a specific order: frames are on pages, which are inside a document, which is inside the InDesign application object. When we speak of an *object model* or a *hierarchy*, we are talking about this structure. Understanding the object model is the key to finding the object you want to work with, and your best guide to InDesign scripting is your knowledge of InDesign itself.

Objects have *properties* (attributes). For example, the properties of a text object include the font used to format the text, the point size, and the leading applied to the text.

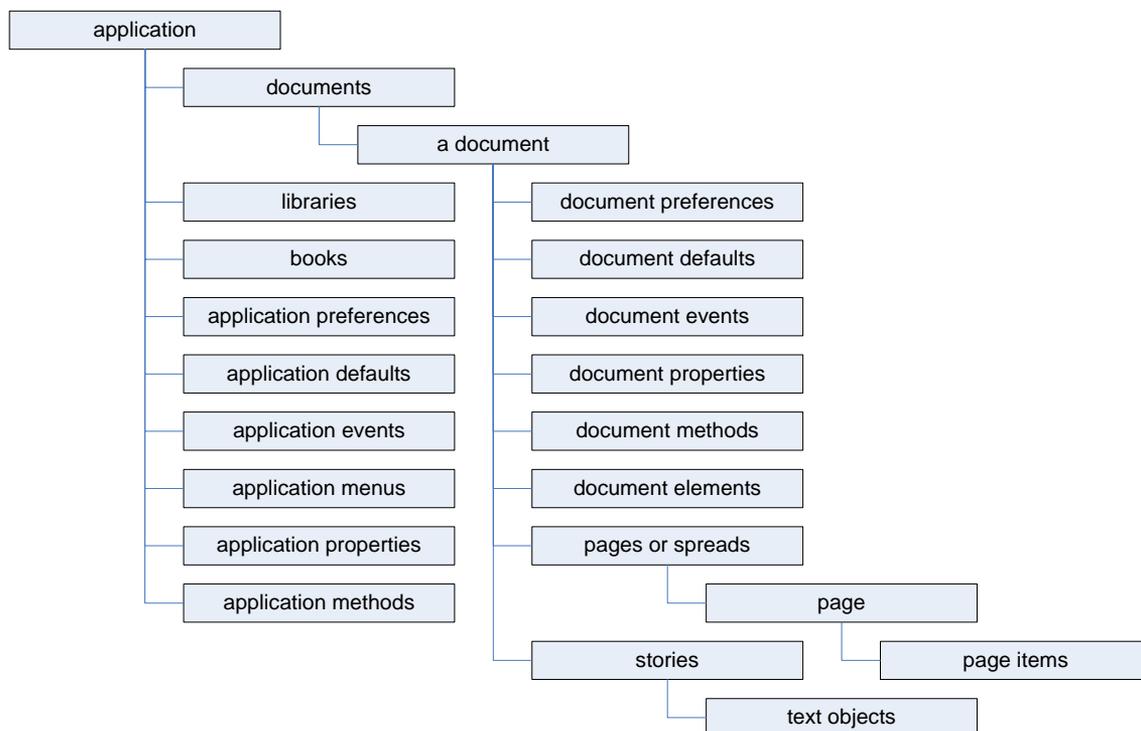

Properties have values; for example, the point size of text can be either a number (in points) or the string “Auto” for auto leading. The fill color property of text can be set to a color, a gradient, a mixed ink, or a swatch.

Properties also can be *read/write* or *read only*. Read/write properties can be set to other values; read only properties cannot.

Objects also have *methods*—the verbs of the scripting world, or the actions an object can perform. For example, the document object has print, export, and save methods.

Methods have *parameters*, or values that define the effect of the method. For example, the place method of a document has a parameter that defines the file you want to place. Parameters can be *required* or *optional*, depending on the method.

The following figure is an overview of the InDesign object model. The diagram is not a comprehensive list of the objects available to InDesign scripting; instead, it is a conceptual framework for understanding the relationships between the types of objects.

The objects in the diagram are explained in the following table:

Term	What it Represents
Application	InDesign.
Application defaults	Application default settings, like colors, paragraph styles, and object styles. Application defaults affect all new documents.
Application events	The things that happen as a user or script works with the application. Events are generated by opening, closing, or saving a document or choosing a menu item. Scripts can be triggered by events.
Application menus	The menus, submenus, and context menus displayed in the InDesign user interface. Scripts can be attached to menu choices and can execute menu actions.
Application methods	The actions the application can take; for example, finding and changing text, copying the selection, creating new documents, and opening libraries.
Application preferences	For example, text preferences, PDF export preferences, and document preferences. Many of the preferences objects also exist at the document level. Just as in the user interface, application preferences are applied to new documents. Document preferences change the settings of a specific document.
Application properties	The properties of the application; for example, the full path to the application, the locale of the application, and the user name.
Books	A collection of open books.
Document	An InDesign document.
Document defaults	Document default settings, like colors, paragraph styles, and text formatting defaults.

Term	What it Represents
Document elements	For example, the stories, imported graphics, and pages of a document. The figure that precedes this table shows pages and stories, because those objects are very important containers for other objects, but document elements also include rectangles, ovals, groups, XML elements, and any other type of object you can import or create.
Document events	Events that occur at the document level, like importing text. See “application events” in this table.
Document methods	The actions the document can take; for example, closing a document, printing a document, and exporting a document.
Document preferences	The preferences of a document, like guide preferences, view preferences, and document preferences.
Document properties	For example, the document filename, number of pages, and zero point location.
Documents	A collection of open documents.
Libraries	A collection of open libraries.
Page	A single page in an InDesign document.
Page items	Any object you can create or place on a page. There are many types of page items, such as text frames, rectangles, graphic lines, or groups.
Pages or spreads	The pages or spreads in an InDesign document.
Stories	The text in an InDesign document.
Text objects	Characters, words, lines, paragraphs, and text columns are examples of text objects in an InDesign story.

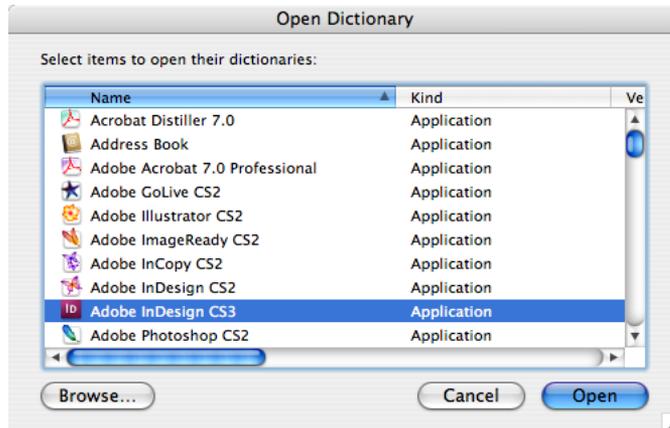

Looking at the InDesign Object Model

You can view the InDesign object model from inside your script-editing application. All reference information on objects and their properties and methods is stored in the model and can be viewed

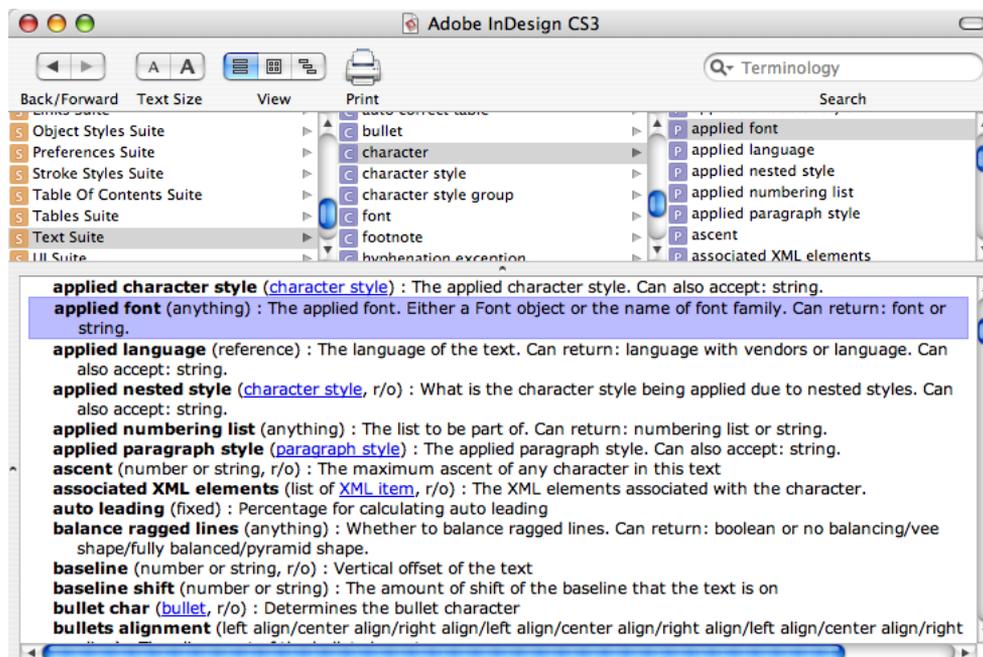

AppleScript

To view the InDesign AppleScript dictionary, follow these steps:

1. Start InDesign.
2. Start the Apple Script Editor.
3. In the Script Editor, choose File > Open Dictionary. The Script Editor displays a list of scriptable applications:

4. Select your copy of InDesign, and click OK. The Script Editor displays a list of InDesign's suites (collections of related objects):

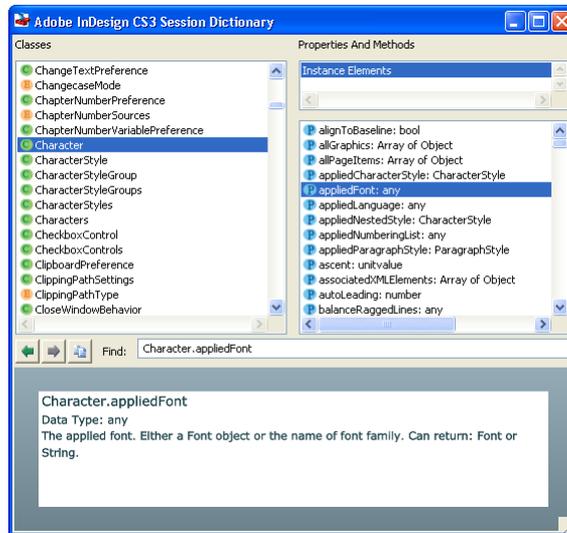

5. Select a suite, to see the objects and methods (commands) it contains. Select an object, to see the properties associated with it.

JavaScript

To view the InDesign object model in the ExtendScript Toolkit, follow these steps:

1. Start the ExtendScript Toolkit.
2. Choose Help > InDesign CS3 Main Dictionary. The ExtendScript Toolkit loads the InDesign dictionary and displays it in a separate window.
3. From the Classes list, select the object you want to view, then click the property or method you want to view in more detail in the Properties and Methods list. The ExtendScript toolkit displays more information on the property or method you selected:

Note: For more on using the ExtendScript Toolkit object-model viewer, see *Creative Suite 3 JavaScript Tools Guide*.

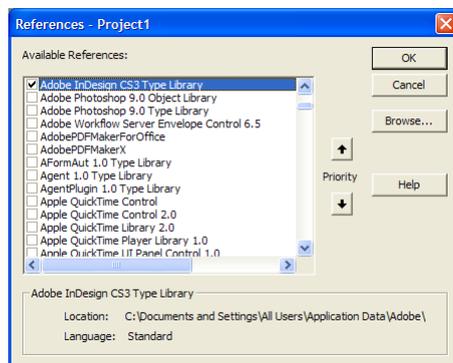

VBScript

To view the InDesign object model, you need a VBScript editor/debugger or some version of Visual Basic, or an application that incorporates Visual Basic for Applications.

► Visual Basic 6

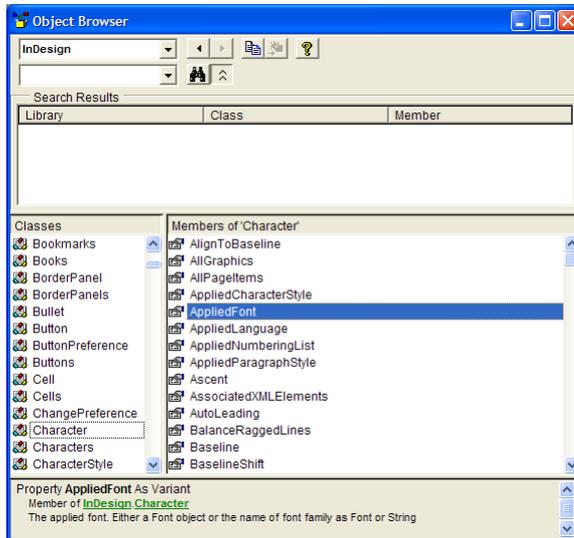

To view the object model using Visual Basic 6, follow these steps:

1. Create a new Visual Basic project, then choose Project > References. Visual Basic displays the References dialog box:

2. From the list of available references, select Adobe InDesign CS3 Type Library, and click OK. If the library does not appear in the list of available references, click Browse and locate and select the file Resources for Visual Basic.tlb, which is usually inside `~:\Documents and Settings\user_name\Application Data\Adobe\InDesign\Version 5.0\Scripting Support\` (where `user_name` is your user name). If necessary, search for the file. Once you locate the file, click Open to add the reference to your project.
3. Choose View > Object Browser. Visual Basic displays the Object Browser dialog box.
4. From the list of open libraries shown in the Project/Library menu, choose InDesign. Visual Basic displays the objects that make up the InDesign object model.

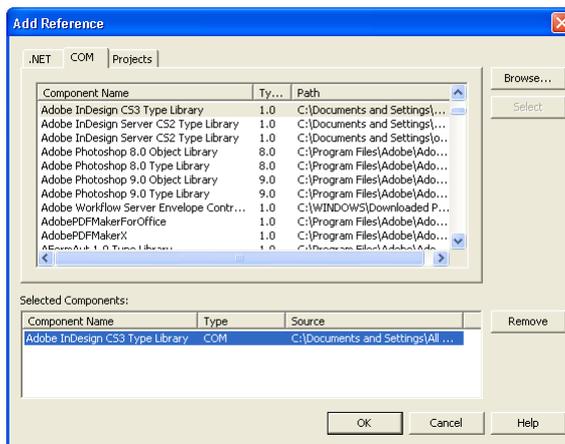

- Click an object class. Visual Basic displays the properties and methods of the object. For more information on a property or method, select the item; Visual Basic displays the definition of the item at the bottom of the Object Browser window:

► Visual Basic.NET

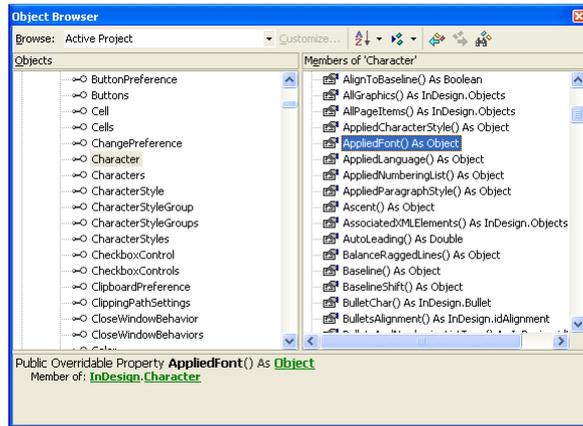

To view the object model using Visual Basic.NET, follow these steps:

- Create a new Visual Basic project, then choose Project > Add Reference. Visual Basic displays the Add Reference dialog box.
- Select the COM tab.
- From the list of available references, select Adobe InDesign CS3 Type Library, and click Select. Visual Basic.NET adds the reference to the Selected Components list. If the library does not appear in the list of available references, click Browse and locate and select the `Resources for Visual .tlb` file, which usually is in `~:\Documents and Settings\user_name\Application Data\Adobe\InDesign\Version 5.0\Scripting Support\` (where `user_name` is your user name). Once you find the file, click Open to add the reference to your project:

- Click OK.
- Choose View > Object Browser. Visual Basic displays the Object Browser tab.

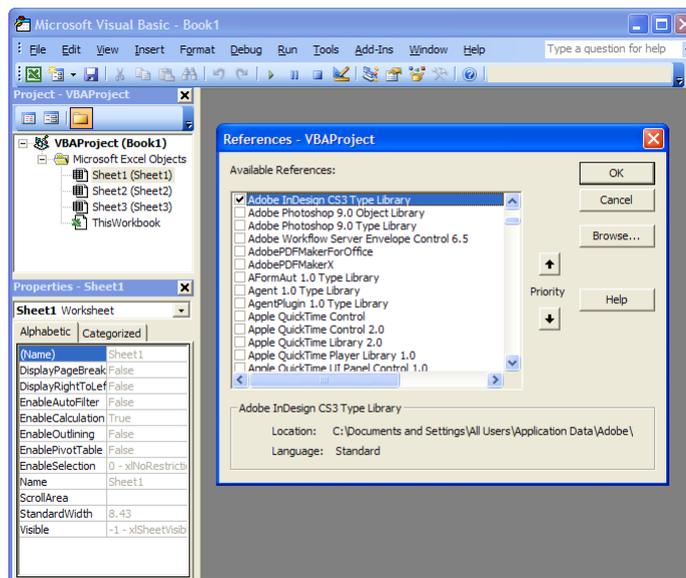

6. From the list of open libraries in the Objects window, choose `interop.indesign.Visual Basic.NET`. Visual Basic.NET displays the objects that make up the InDesign object model.
7. Click an object class. Visual Basic.NET displays the properties and methods of the object. For more information on a property or method, select the item; Visual Basic.NET displays the definition of the item at the bottom of the Object Browser window:

► Visual Basic for Applications

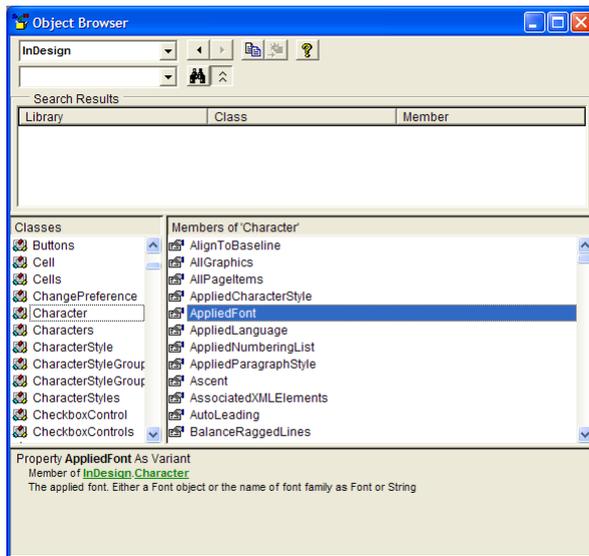

To view the object model using Visual Basic for Applications from Microsoft Excel, follow these steps:

1. Start Excel.
2. Choose **Tools > Macros > Visual Basic Editor**. Excel displays the Visual Basic Editor window.
3. Choose **Tools > References**. The Visual Basic Editor displays the Add References dialog box:

4. From the list of available references, select `Adobe InDesign CS3 Type Library` option, and click **Select**. Visual Basic adds the reference to the Selected Components list. If the library does not appear in the list of available references, click **Browse** and locate and select the `Resources for Visual Basic.tlb` file, which usually is in `~:\Documents and Settings\user_name\Application Data\Adobe\InDesign\Version 5.0\Scripting Support\` (where `user_name` is your user name). Once you find the file, click **OK** to add the reference to your project.
5. Choose **View > Object Browser**. The Visual Basic editor display the Object Browser window.

6. From the Libraries pop-up menu, choose InDesign. The Visual Basic editor displays a list of the objects in the InDesign object library.
7. Click an object name. The Visual Basic Editor displays the properties and methods of the object. For more information on a property or method, select the item; Visual Basic displays the definition of the item at the bottom of the Object Browser window:

Measurements and Positioning

All items and objects in InDesign are positioned on the page according to measurements you choose. It is useful to know how the InDesign coordinate system works and what measurement units it uses.

Coordinates

InDesign, like every other page-layout and drawing program, uses simple, two-dimensional geometry to set the position of objects on a page or spread. The horizontal component of a coordinate pair is referred to as *x*; the vertical component, *y*. You can see these coordinates in the Transform panel or Control when you select an object using the Selection tool. As in the InDesign user interface, coordinates are measured relative to the current location of the ruler's zero point.

There is one difference between the coordinates used in InDesign and the coordinate system used in a Geometry textbook: on InDesign's vertical (or *y*) axis, coordinates *below* the zero point are positive numbers; coordinates *above* the zero point are negative numbers.

Note: When you ask InDesign for the location of a path point, the coordinates are returned in *x, y* order. When you set the location of a path point, InDesign expects you to provide the coordinates in the same order. InDesign returns some coordinates in a different order, however, and it expects you to supply them in that order. Geometric bounds and visible bounds are arrays containing four coordinates, which define (in order) the top, left, bottom, and right edges of the object's bounding box (or *y1, x1, y2, x2*).

Working with Measurement Units

When you send measurement values to InDesign, you can send numbers (for example, 14.65) or measurement strings (for example, "1p7.1"). If you send numbers, InDesign uses the publication's current units of measurement. If you send measurement strings (see the table below), InDesign uses the units of measurement specified in the string.

InDesign returns coordinates and other measurement values using the publication’s current measurement units. In some cases, these units do not resemble the measurement values shown in the InDesign Transform panel. For example, if the current measurement system is picas, InDesign returns fractional values as decimals, rather than using the picas-and-points notation used by the Transform panel. “1p6,” for example, is returned as “1.5.” InDesign does this because your scripting system would have trouble trying to perform arithmetic operations using measurement strings; for instance, trying to add “0p3.5” to “13p4” produces a script error, while adding .2916 to 13.333 (the converted pica measurements) does not.

If your script depends on adding, subtracting, multiplying, or dividing specific measurement values, you might want to set the corresponding measurement units at the beginning of the script. At the end of the script, you can set the measurement units back to whatever they were before you ran the script. Alternately, you can use measurement overrides, like many of the sample scripts. A measurement override is a string containing a special character, as shown in the following table:

Override	Meaning	Example
c	Ciceros (add didots after the c, if necessary)	1.4c
cm	Centimeters	.635cm
i (or in)	Inches	.25i
mm	Millimeters	6.35mm
p	Picas (add points after the p, if necessary)	1p6
pt	Points	18pt

Adding Features to “Hello World”

Next, we will create a new script that makes changes to the “Hello World” publication that we created with our first script. Our second script demonstrates how to do the following:

- Get the active document.
- Use a function (or *handler* in AppleScript).
- Get the page dimensions and page margins of the active document.
- Resize a text frame.
- Change the formatting of the text in the text frame.

AppleScript

Either open the ImprovedHelloWorld.applescript tutorial script, or perform the following steps to create the script:

1. Make sure you have the Hello World document open. If you closed the document without saving it, simply run the `HelloWorld.applescript` script again to make a new Hello World document.
2. In the Script Editor, choose File > New to create a new script.

3. Enter the following code:

```
--Improved "Hello World"
tell application "Adobe InDesign CS3"
  --Get a reference to a font.
  try
    --Enter the name of a font on your system, if necessary.
    set myFont to font "Helvetica"
  end try
  --Get the active document and assign
  --the result to the variable "myDocument."
  set myDocument to document 1
  tell myDocument
    --Use the handler "myGetBounds" to get the bounds of the
    --"live area" inside the margins of page 1.
    set myBounds to my myGetBounds(myDocument, page 1)
    tell text frame 1 of page 1
      --Resize the text frame to match the page margins.
      set geometric bounds to myBounds
      tell paragraph 1
        --Change the font, size, and paragraph alignment.
        try
          set applied font to myFont
        end try
        set point size to 72
        set justification to center align
      end tell
    end tell
  end tell
end tell
--myGetBounds is a handler that returns the bounds
--of the "live area" of a page.
on myGetBounds(myDocument, myPage)
  tell application "Adobe InDesign CS2"
    set myPageHeight to page height of document preferences of myDocument
    set myPageWidth to page width of document preferences of myDocument
    set myLeft to left of margin preferences of myPage
    set myTop to top of margin preferences of myPage
    set myRight to right of margin preferences of myPage
    set myBottom to bottom of margin preferences of myPage
  end tell
  set myRight to myPageWidth - myLeft
  set myBottom to myPageHeight - myBottom
  return {myTop, myLeft, myBottom, myRight}
end myGetBounds
```

4. Save the script.

5. Run the new script.

JavaScript

Either open the `ImprovedHelloWorld.jsx` tutorial script, or perform the following steps to create the script:

1. Make sure you have the Hello World document open. If you closed the document without saving it, simply run the `HelloWorld.jsx` script again to make a new Hello World document.
2. Enter the following JavaScript in a new text file:

```
//Improved Hello World!  
//Enter the name of a font on your system, if necessary.  
myFont = app.fonts.item("Arial");  
var myDocument = app.documents.item(0);  
with(myDocument) {  
    var myPage = pages.item(0);  
    var myBounds = myGetBounds(myPage, myDocument);  
    with(myDocument.pages.item(0)) {  
        //Get a reference to the text frame.  
        var myTextFrame = textFrames.item(0);  
        //Change the size of the text frame.  
        myTextFrame.geometricBounds = myBounds;  
        var myParagraph = myTextFrame.paragraphs.item(0);  
        myParagraph.appliedFont = myFont;  
        myParagraph.justification = Justification.centerAlign;  
        myParagraph.pointSize = 48;  
    }  
}  
//myGetBounds calculates and return the bounds of the "live area" of the page.  
function myGetBounds(myDocument, myPage) {  
    var myWidth = myDocument.documentPreferences.pageWidth;  
    var myHeight = myDocument.documentPreferences.pageHeight;  
    var myX1 = myPage.marginPreferences.left;  
    var myY1 = myPage.marginPreferences.top;  
    var myX2 = myWidth - myPage.marginPreferences.right;  
    var myY2 = myHeight - myPage.marginPreferences.bottom;  
    return [myY1, myX1, myY2, myX2];  
}
```

3. Save the text as a plain text file with the file extension `.jsx` in the Scripts Panel folder (see "Installing Scripts" on page 4).
4. Run the new script, by double-clicking the script name in the InDesign Scripts panel.

VBScript

Either open the `ImprovedHelloWorld.vbs` tutorial script, or perform the following steps to create the script:

1. Start any text editor (for example, Notepad).
2. Make sure you have the Hello World document open. If you closed the document without saving it, simply run the `HelloWorld.vbs` script again to make a new Hello World document.

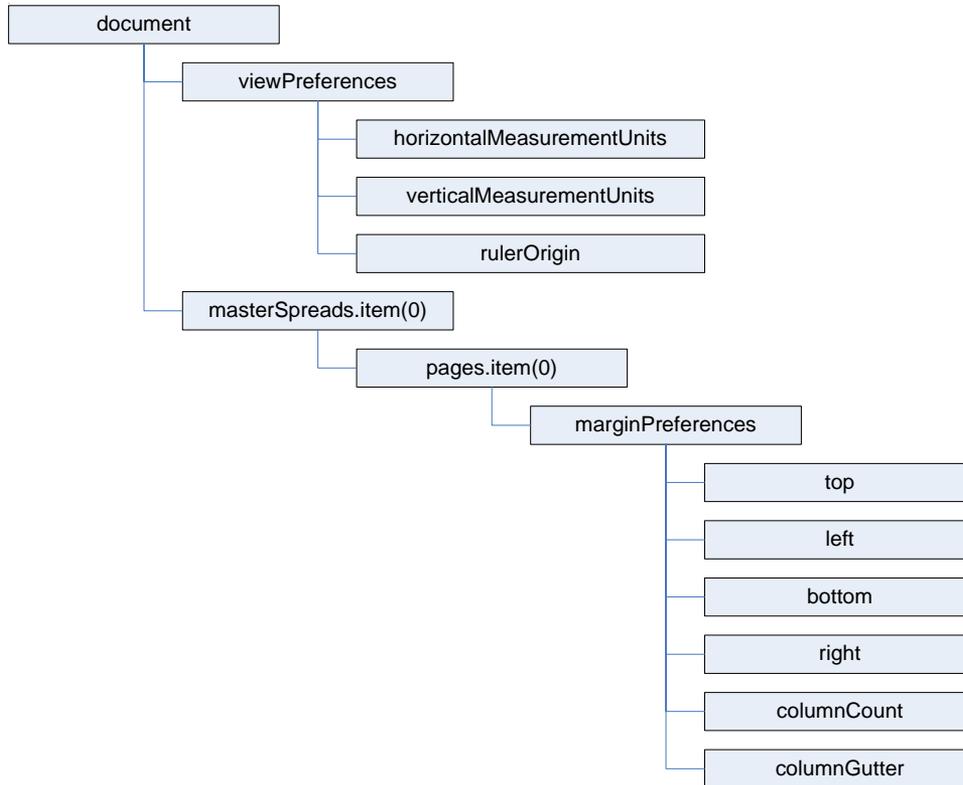

3. Enter the following code:

```
Set myInDesign = CreateObject("InDesign.Application.CS3")
Rem Enter the name of a font on your system, if necessary.
Set myFont = myInDesign.Fonts.Item("Arial")
Set myDocument = myInDesign.ActiveDocument
Set myPage = myDocument.Pages.Item(1)
Rem Get page width and page height using the function "myGetBounds".
myBounds = myGetBounds(myDocument, myPage)
Set myTextFrame = myPage.TextFrames.Item(1)
Rem Resize the text frame to match the publication margins.
myTextFrame.GeometricBounds = myBounds
Set myParagraph = myTextFrame.Paragraphs.Item(1)
Rem Change the font, size, and alignment.
If TypeName(myFont) <> "Nothing" Then
    myParagraph.AppliedFont = myFont
End If
myParagraph.PointSize = 48
myParagraph.Justification = idJustification.idCenterAlign
Function myGetBounds(myDocument, myPage)
    myPageHeight = myDocument.DocumentPreferences.PageHeight
    myPageWidth = myDocument.DocumentPreferences.PageWidth
    myTop = myPage.MarginPreferences.Top
    myLeft = myPage.MarginPreferences.Left
    myRight = myPage.MarginPreferences.Right
    myBottom = myPage.MarginPreferences.Bottom
    myRight = myPageWidth - myRight
    myBottom = myPageHeight - myBottom
    myGetBounds = Array(myTop, myLeft, myBottom, myRight)
End Function
```

4. Save the text as a plain text file with the file extension `.vbs` in the Scripts folder (see “Installing Scripts” on page 4).
5. Run the new script, by double-clicking the script name in the InDesign Scripts panel.

Constructing a Document

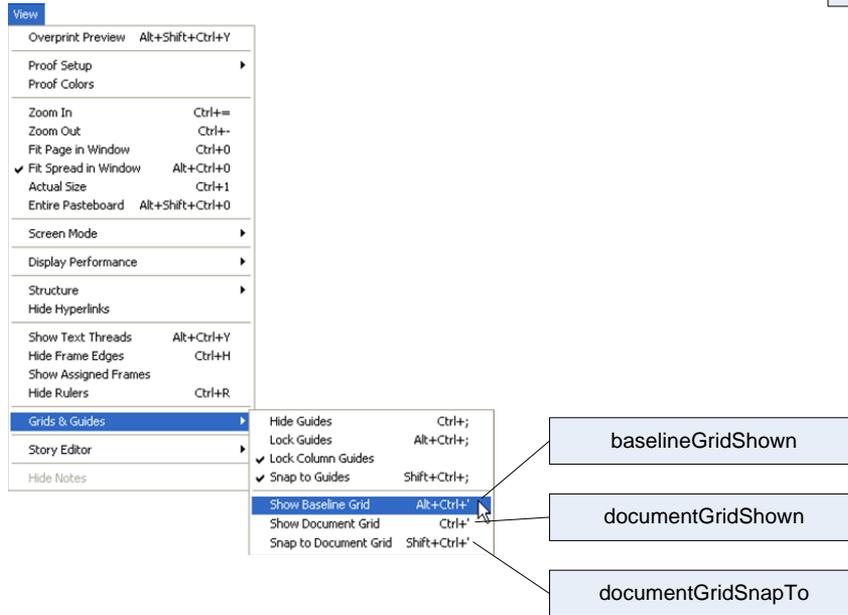

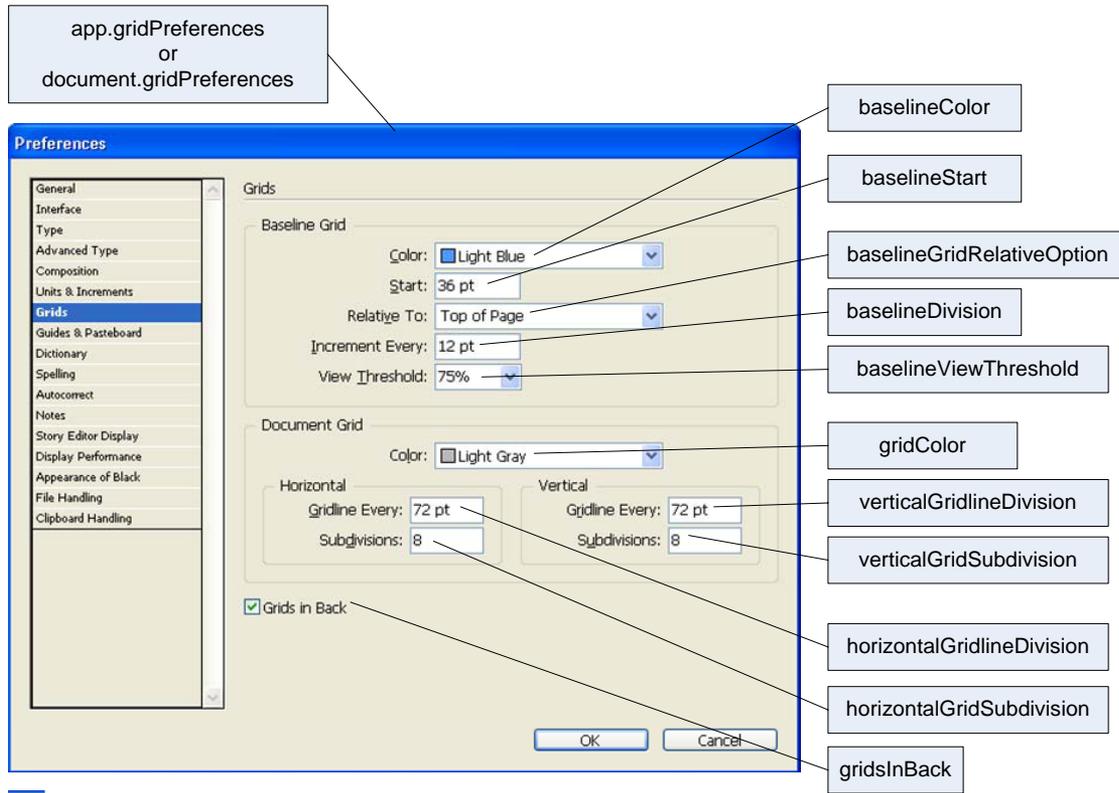

Obviously, our “Hello World!” script is not very useful in your daily work. While you can use an InDesign script at any point in your production process, we will start by creating scripts that start at the same point you do—creating new documents, setting page margins, and creating and applying master pages. The following figure shows the objects with which we will work.

In this section, we create one long script by adding short blocks of scripting code. Each block demonstrates a specific area or task in InDesign scripting. As you enter each block, you can run the script to see what happens. If you are using AppleScript, you will need to add the text `end tell` to the end of the script before you run it, then remove the text before continuing.

Note: The figure above uses the JavaScript version of the scripting terms. For AppleScript, you would add spaces between words (`view preferences`, rather than `viewPreferences`); for VBScript, you would use an item index starting at 1, rather than 0 (`masterSpreads.item(1)`, rather than `masterSpreads.item(0)`).

The objects in the object model generally correspond to the names of controls in the user interface, as shown in the following diagram (which, again, uses the JavaScript form of the scripting terms):

Setting up Measurement Units and Master Spread Margins

The following script shows how to create a new document and set the margins of the first master spread. In this section, we show how to build a complex script using simple “building blocks” of scripting code. Start your script editor and enter the following lines in the scripting language of your choice. After you enter each block of code, save the script in your Scripts Panel folder (see “Installing Scripts” on page 4).

AppleScript

Either enter the following code in the Script Editor or open the `DocumentConstruction.applescript` tutorial script:

```
tell application "Adobe InDesign CS3"
  --Create a new document.
  set myDocument to make document
  --Set the measurement units and ruler origin.
  set horizontal measurement units of view preferences to points
  set vertical measurement units of view preferences to points
  set ruler origin of view preferences to page origin
  --Get a reference to the first master spread.
  set myMasterSpread to master spread 1 of myDocument
  --Get a reference to the margin preferences of
  --the first page in the master spread.
  set myMarginPreferences to margin preferences of page 1 of myMasterSpread
  --Now set up the page margins and columns.
  set left of myMarginPreferences to 84
  set top of myMarginPreferences to 70
  set right of myMarginPreferences to 70
  set bottom of myMarginPreferences to 78
  set column count of myMarginPreferences to 3
  set column gutter of myMarginPreferences to 14
  --Page margins and columns for the right-hand page.
  set myMarginPreferences to margin preferences of page 2 of myMasterSpread
  set left of myMarginPreferences to 84
  set top of myMarginPreferences to 70
  set right of myMarginPreferences to 70
  set bottom of myMarginPreferences to 78
  set column count of myMarginPreferences to 3
  set column gutter of myMarginPreferences to 14
```

JavaScript

Either enter the following code in the ExtendScript Toolkit or open the `DocumentConstruction.jsx` tutorial script:

```
//Create a new document.
var myDocument = app.documents.add();
//Set the measurement units and ruler origin.
myDocument.viewPreferences.horizontalMeasurementUnits =
MeasurementUnits.points;
myDocument.viewPreferences.verticalMeasurementUnits = MeasurementUnits.points;
myDocument.viewPreferences.rulerOrigin = RulerOrigin.pageOrigin;
//Get a reference to the first master spread.
var myMasterSpread = myDocument.masterSpreads.item(0);
//Get a reference to the margin preferences of the first page in the master
spread.
var myMarginPreferences = myMasterSpread.pages.item(0).marginPreferences;
//Now set up the page margins and columns.
myMarginPreferences.left = 84;
myMarginPreferences.top = 70;
myMarginPreferences.right = 70;
myMarginPreferences.bottom = 78;
myMarginPreferences.columnCount = 3;
myMarginPreferences.columnGutter = 14;
//Page margins and columns for the right-hand page.
var myMarginPreferences = myMasterSpread.pages.item(1).marginPreferences;
myMarginPreferences.left = 84;
myMarginPreferences.top = 70;
myMarginPreferences.right = 70;
myMarginPreferences.bottom = 78;
myMarginPreferences.columnCount = 3;
myMarginPreferences.columnGutter = 14;
```

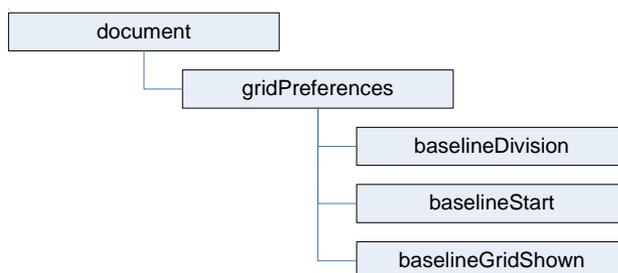

VBScript

Either enter the following code in your script or text editor, or open the `DocumentConstruction.vbs` tutorial script.

```
Set myInDesign = CreateObject("InDesign.Application.CS3")
Rem Create a new document.
Set myDocument = myInDesign.Documents.Add()
Rem Set the measurement units and ruler origin.
myDocument.ViewPreferences.HorizontalMeasurementUnits =
idMeasurementUnits.idPoints
myDocument.ViewPreferences.VerticalMeasurementUnits =
idMeasurementUnits.idPoints
myDocument.ViewPreferences.RulerOrigin = idRulerOrigin.idPageOrigin
Rem Get a reference to the first master spread.
Set myMasterSpread = myDocument.MasterSpreads.Item(1)
Rem Get a reference to the margin preferences of the first page in the master
spread.
Set myMarginPreferences = myMasterSpread.Pages.Item(1).MarginPreferences
Rem Now set up the page margins and columns.
myMarginPreferences.Left = 84
myMarginPreferences.Top = 70
myMarginPreferences.Right = 70
myMarginPreferences.Bottom = 78
myMarginPreferences.ColumnCount = 3
myMarginPreferences.ColumnGutter = 14
Rem Page margins and columns for the right-hand page.
Set myMarginPreferences = myMasterSpread.Pages.Item(2).MarginPreferences
myMarginPreferences.Left = 84
myMarginPreferences.Top = 70
myMarginPreferences.Right = 70
myMarginPreferences.Bottom = 78
myMarginPreferences.ColumnCount = 3
myMarginPreferences.ColumnGutter = 14
```

Adding a Baseline Grid

Now that we have a master spread set up, we will add a baseline grid. Add the following script lines (from the appropriate language) to the end of the script you created earlier. Again, here is a diagram (with the scripting terms shown in their JavaScript form):

AppleScript

```
set myGridPreferences to grid preferences
set baseline division of myGridPreferences to 14
set baseline start of myGridPreferences to 70
set baseline grid shown of myGridPreferences to true
```

JavaScript

```
var myGridPreferences = myDocument.gridPreferences;  
myGridPreferences.baselineDivision = 14;  
myGridPreferences.baselineStart = 70;  
myGridPreferences.baselineGridShown = true;
```

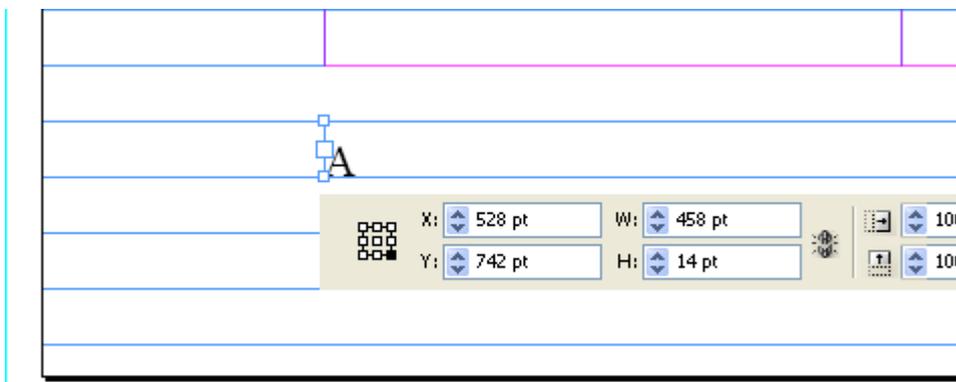

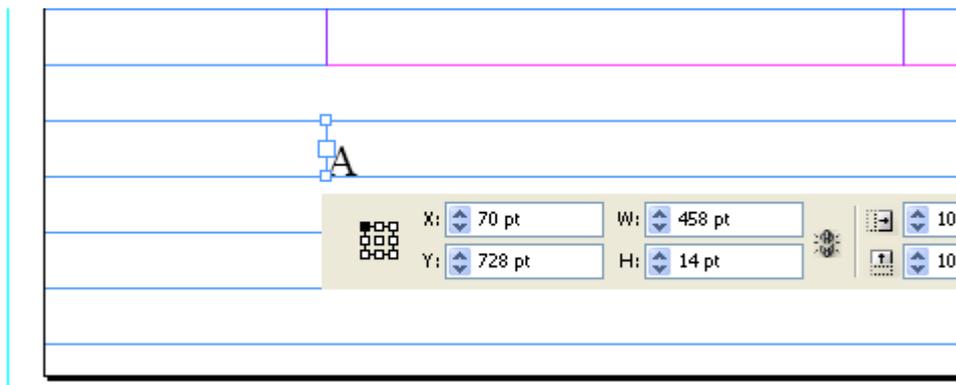

VBScript

```
Set myGridPreferences = myDocument.GridPreferences  
myGridPreferences.BaselineDivision = 14  
myGridPreferences.BaselineStart = 70  
myGridPreferences.BaselineGridShown = True
```

Adding Master Page Items

Next, we add two text frames to the master pages. These frames will contain the auto-page-number special character and will be positioned at the bottom of the page.

In the “Hello World” example, we created a text frame and specified its position and size using the geometric bounds property—an array containing the top, left, bottom, and right coordinates for the frame. The coordinates correspond to the corners of the frame, just as they would appear in the Control panel. The geometric bounds are: top = 728, left = 70, bottom = 742, and right = 528, as shown in the following two figures:

AppleScript

```
set myLeftPage to page 1 of myMasterSpread
set myRightPage to page 2 of myMasterSpread
tell myLeftPage
    set myLeftFooter to make text frame
    set geometric bounds of myLeftFooter to {728, 70, 742, 528}
    set first baseline offset of text frame preferences of myLeftFooter to
leading offset
    set contents of myLeftFooter to auto page number
    set point size of character 1 of parent story of myLeftFooter to 11
    set leading of character 1 of myLeftFooter to 14
end tell
tell myRightPage
    set myRightFooter to make text frame
    set geometric bounds of myRightFooter to {728, 84, 742, 542}
    set first baseline offset of text frame preferences of myRightFooter to
leading offset
    set contents of myRightFooter to auto page number
    set point size of character 1 of parent story of myRightFooter to 11
    set leading of character 1 of myRightFooter to 14
    set justification of character 1 of myRightFooter to right align
end tell
```

JavaScript

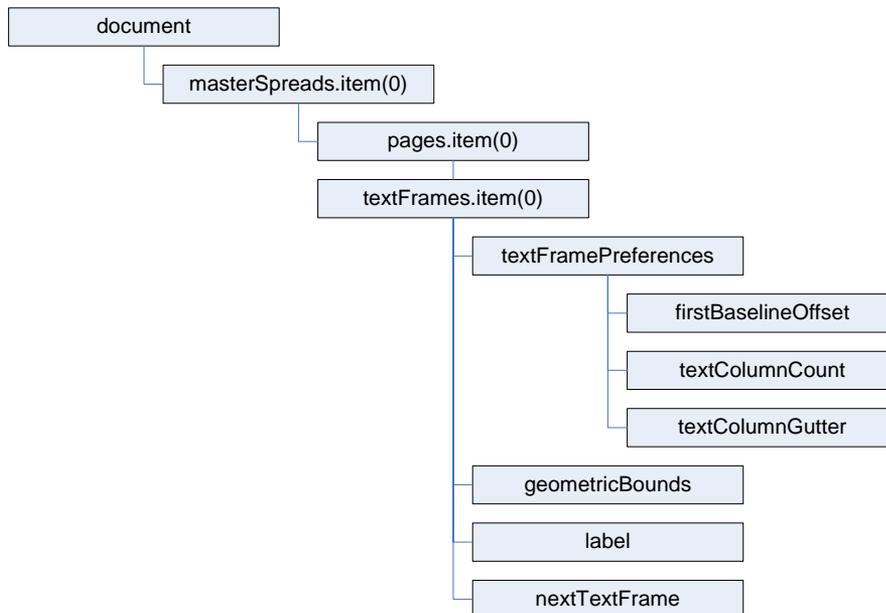

```
var myMasterSpread = myDocument.masterSpreads.item(0);
var myLeftPage = myMasterSpread.pages.item(0);
var myRightPage = myMasterSpread.pages.item(1);
var myLeftFooter = myLeftPage.textFrames.add();
myLeftFooter.geometricBounds = [728, 70, 742, 528];
myLeftFooter.textFramePreferences.firstBaselineOffset =
FirstBaseline.leadingOffset;
myLeftFooter.contents = SpecialCharacters.autoPageNumber;
myLeftFooter.parentStory.characters.item(0).pointSize = 11;
myLeftFooter.parentStory.characters.item(0).leading = 14;
var myRightFooter = myRightPage.textFrames.add();
myRightFooter.geometricBounds = [728, 84, 742, 542];
myRightFooter.textFramePreferences.firstBaselineOffset =
FirstBaseline.leadingOffset;
myRightFooter.contents = SpecialCharacters.autoPageNumber;
myRightFooter.parentStory.characters.item(0).pointSize = 11;
myRightFooter.parentStory.characters.item(0).leading = 14;
myRightFooter.parentStory.characters.item(0).justification =
Justification.rightAlign;
```

VBScript

```
Set myMasterSpread = myDocument.MasterSpreads.Item(1)
Set myLeftPage = myMasterSpread.Pages.Item(1)
Set myRightPage = myMasterSpread.Pages.Item(2)
Set myLeftFooter = myLeftPage.TextFrames.Add
myLeftFooter.GeometricBounds = Array(728, 70, 742, 528)
myLeftFooter.TextFramePreferences.FirstBaselineOffset =
idFirstBaseline.idLeadingOffset
myLeftFooter.Contents = idSpecialCharacters.idAutoPageNumber
myLeftFooter.ParentStory.Characters.Item(1).PointSize = 11
myLeftFooter.ParentStory.Characters.Item(1).Leading = 14
Set myRightFooter = myRightPage.TextFrames.Add()
myRightFooter.GeometricBounds = Array(728, 84, 742, 542)
myRightFooter.TextFramePreferences.FirstBaselineOffset =
idFirstBaseline.idLeadingOffset
myRightFooter.Contents = idSpecialCharacters.idAutoPageNumber
myRightFooter.ParentStory.Characters.Item(1).PointSize = 11
myRightFooter.ParentStory.Characters.Item(1).Leading = 14
myRightFooter.ParentStory.Characters.Item(1).Justification =
idJustification.idRightAlign
```

Adding Master Text Frames

Next, we add master text frames. The following block diagram shows the objects and properties with which we will work (the diagram uses the JavaScript form of the scripting terms):

AppleScript

```
tell myLeftPage
  set myLeftTextFrame to make text frame
  set geometric bounds of myLeftTextFrame to {70, 70, 714, 528}
  set first baseline offset of text frame preferences of myLeftTextFrame to
leading offset
  set text column count of text frame preferences of myLeftTextFrame to 3
  set text column gutter of text frame preferences of myLeftTextFrame to 14
  --Add a label to make the frame easier to find later on.
  set label of myLeftTextFrame to "BodyTextFrame"
end tell
tell myRightPage
  set myRightTextFrame to make text frame
  set geometric bounds of myRightTextFrame to {70, 84, 714, 542}
  set first baseline offset of text frame preferences of myRightTextFrame to
leading offset
  set text column count of text frame preferences of myRightTextFrame to 3
  set text column gutter of text frame preferences of myRightTextFrame to 14
  --Add a label to make the frame easier to find later on.
  set label of myRightTextFrame to "BodyTextFrame"
end tell
--Link the two frames using the next text frame property.
set next text frame of myLeftTextFrame to myRightTextFrame
```

JavaScript

```
var myLeftPage = myMasterSpread.pages.item(0);
var myRightPage = myMasterSpread.pages.item(1);
var myLeftTextFrame = myLeftPage.textFrames.add();
myLeftTextFrame.geometricBounds = [70, 70, 714, 528];
myLeftTextFrame.textFramePreferences.firstBaselineOffset =
FirstBaseline.leadingOffset;
myLeftTextFrame.textFramePreferences.textColumnCount = 3;
myLeftTextFrame.textFramePreferences.textColumnGutter = 14;
//Add a label to make the frame easier to find later on.
myLeftTextFrame.label = "BodyTextFrame";
var myRightTextFrame = myRightPage.textFrames.add();
myRightTextFrame.geometricBounds = [70, 84, 714, 542];
myRightTextFrame.textFramePreferences.firstBaselineOffset =
FirstBaseline.leadingOffset;
myRightTextFrame.textFramePreferences.textColumnCount = 3;
myRightTextFrame.textFramePreferences.textColumnGutter = 14;
//Add a label to make the frame easier to find later on.
myRightTextFrame.label = "BodyTextFrame";
//Link the two frames using the nextTextFrame property.
myLeftTextFrame.nextTextFrame = myRightTextFrame;
```

VBScript

```
Set myLeftTextFrame = myLeftPage.TextFrames.Add
myLeftTextFrame.GeometricBounds = Array(70, 70, 714, 528)
myLeftTextFrame.TextFramePreferences.FirstBaselineOffset =
idFirstBaseline.idLeadingOffset
myLeftTextFrame.TextFramePreferences.TextColumnCount = 3
myLeftTextFrame.TextFramePreferences.TextColumnGutter = 14
Rem Add a label to make the frame easier to find later on.
myLeftTextFrame.Label = "BodyTextFrame"
Set myRightTextFrame = myRightPage.TextFrames.Add
myRightTextFrame.GeometricBounds = Array(70, 84, 714, 542)
myRightTextFrame.TextFramePreferences.FirstBaselineOffset =
idFirstBaseline.idLeadingOffset
myRightTextFrame.TextFramePreferences.TextColumnCount = 3
myRightTextFrame.TextFramePreferences.TextColumnGutter = 14
Rem Add a label to make the frame easier to find later on.
myRightTextFrame.Label = "BodyTextFrame"
Rem Link the two frames using the nextTextFrame property.
myLeftTextFrame.NextTextFrame = myRightTextFrame
```

Overriding Master Page Items and Adding Text

Next, we override one of the master text frames we created and add text to it. Again, add this script to the end of the script we have been working on.

AppleScript

```
tell text frame 1 of page 2 of master spread 1 of myDocument
  set myTextFrame to override destination page page 1 of myDocument
end tell
--Add text by setting the contents of an insertion point to a string.
--In AppleScript, "return" is a return character.
set contents of insertion point 1 of myTextFrame to "Headline!" & return
```

JavaScript

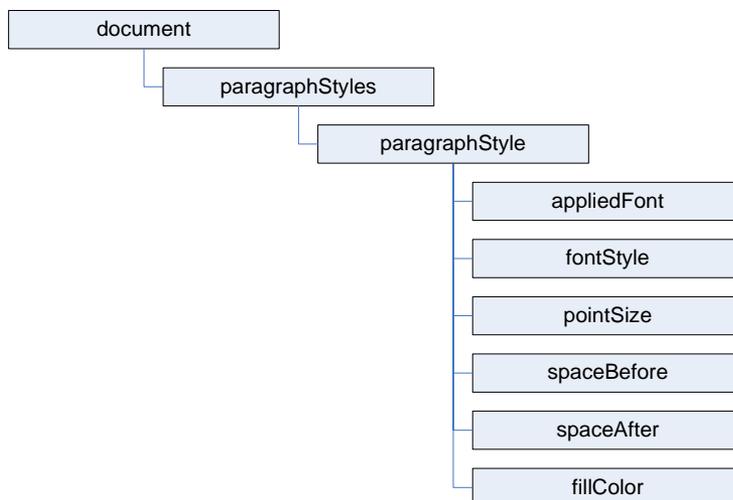

```
var myTextFrame =
myDocument.masterSpreads.item(0).pages.item(1).textFrames.item(0).override(my
Document.pages.item(0));
//Add text by setting the contents of an insertion point to a string.
//In JavaScript, "\r" is a return character.
myTextFrame.insertionPoints.item(0).contents = "Headline!\r";
```

VBScript

```
Set myTextFrame =
myDocument.MasterSpreads.Item(1).Pages.Item(2).TextFrames.Item(1).Override(my
Document.Pages.Item(1))
Rem Add text by setting the contents of an insertion point to a string.
Rem In VBScript, vbCrLf is a return character.
myTextFrame.InsertionPoints.Item(1).Contents = "Headline!" & vbCrLf
```

Adding and Applying a Paragraph Style

Our headline looks plain, so we will format it using a paragraph style. To do that, we must create the paragraph style. The following diagram shows the objects and properties we will work with (again, the text in this diagram uses the JavaScript form of the scripting terms):

AppleScript

```
--First, check to see if the paragraph style already exists.
try
    set myParagraphStyle to paragraph style "Heading 1" of myDocument
on error
    --The paragraph style did not exist, so create it.
    tell myDocument
        set myParagraphStyle to make paragraph style with properties
{name:"Heading 1"}
    end tell
end try
--We'll need to create a color. Check to see if the color already exists.
try
    set myColor to color "Red"
on error
    --The color did not exist, so create it.
    set myColor to make color with properties {name:"Red", model:process, color
value:{0, 100, 100, 0}}
end try
--Now set the formatting of the paragraph style.
set applied font of myParagraphStyle to "Arial"
set font style of myParagraphStyle to "Bold"
set point size of myParagraphStyle to 24
set space after of myParagraphStyle to 24
set space before of myParagraphStyle to 24
set fill color of myParagraphStyle to color "Red" of myDocument
--Apply the style to the paragraph.
tell paragraph 1 of myTextFrame to apply paragraph style using myParagraphStyle
with clearing overrides
--You could also use:
--set applied paragraph style of paragraph 1 of myTextFrame to myParagraphStyle
```

JavaScript

```
var myParagraphStyle = myDocument.paragraphStyles.item("Heading 1");
try {
    var myName = myParagraphStyle.name;
}
catch (myError){
    //The paragraph style did not exist, so create it.
    myParagraphStyle = myDocument.paragraphStyles.add({name:"Heading 1"});
}
//We'll need to create a color. Check to see if the color already exists.
var myColor = myDocument.colors.item("Red");
try {
    myName = myColor.name;
}
catch (myError){
    //The color did not exist, so create it.
    myColor = myDocument.colors.add({name:"Red", model:ColorModel.process,
colorValue:[0,100,100,0]});
}
```

```
//Now set the formatting of the paragraph style.
myParagraphStyle.appliedFont = "Arial";
myParagraphStyle.fontStyle = "Bold";
myParagraphStyle.pointSize = 24;
myParagraphStyle.spaceAfter = 24;
myParagraphStyle.spaceBefore = 24;
myParagraphStyle.fillColor = myDocument.colors.item("Red");
//Apply the style to the paragraph.
myDocument.pages.item(0).textFrames.item(0).paragraphs.item(0).applyParagraph
Style(
myParagraphStyle, true);
//You could also use:
//myDocument.pages.item(0).textFrames.item(0).paragraphs.item(0).appliedParag
raphStyle = myParagraphStyle;
```

VBScript

```
Rem First, check to see if the paragraph style already exists.
Rem to do this, we disable error checking:
On Error Resume Next
Set myParagraphStyle = myDocument.ParagraphStyles.Item("Heading 1")
Rem if an error occurred on the previous line, then the paragraph
Rem style did not exist.
If Error.Number <> 0 Then
    Set myParagraphStyle = myDocument.ParagraphStyles.Add
    myParagraphStyle.Name = "Heading 1"
    Error.Clear
End If
Rem We'll need to create a color. Check to see if the color already exists.
Set myColor = myDocument.Colors.Item("Red")
If Error.Number <> 0 Then
    Set myColor = myDocument.Colors.Add
    myColor.Name = "Red"
    myColor.Model = idColorModel.idProcess
    myColor.colorValue = Array(0, 100, 100, 0)
    Error.Clear
End If
Rem Resume normal error handling.
On Error GoTo 0
Rem Now set the formatting of the paragraph style.
myParagraphStyle.AppliedFont = "Arial"
myParagraphStyle.FontStyle = "Bold"
myParagraphStyle.PointSize = 24
myParagraphStyle.SpaceAfter = 24
myParagraphStyle.SpaceBefore = 24
myParagraphStyle.FillColor = myDocument.Colors.Item("Red")
Rem Apply the style to the paragraph.
myDocument.Pages.Item(1).TextFrames.Item(1).Paragraphs.Item(1).ApplyParagraph
Style myParagraphStyle, True
Rem You could also use:
Rem
myDocument.pages.item(1).textFrames.item(1).paragraphs.item(1).appliedParagra
phStyle = myParagraphStyle
```

Placing a Text File

Next, we import a text file. We add the text after the headline in the first text frame on the first page. The script displays a dialog box you can use to select the text file you want to import. Again, add this script to the end of the script we have been working on.

AppleScript

```
--Display a standard open file dialog box to select a text file.
set myTextFile to choose file ("Choose a text file")
--If a text file was selected, and if you didn't press Cancel,
--place the text file at the first insertion point after the headline.
if myTextFile is not "" then
    tell insertion point -1 of myTextFrame to place myTextFile
end if
```

JavaScript

```
//Display a standard open file dialog box to select a text file.
var myTextFile = File.openDialog("Choose a text file");
//If a text file was selected, and if you didn't press Cancel,
//place the text file at the first insertion point after the headline.
if((myTextFile != "") && (myTextFile != null)) {
    myTextFrame.insertionPoints.item(-1).place(myTextFile);
}
```

VBScript

```
Rem Display a standard open file dialog box to select a text file.
Rem VBScript does not have the ability to do this, so we'll use
Rem a JavaScript to get a file name. We'll run the JavaScript using
Rem InDesign's DoScript feature.
Rem Disable normal error handling.
On Error Resume Next
Rem Create a JavaScript as a string.
myJavaScriptString = "var myTextFile = File.openDialog(""Choose a text
file "");myTextFile.fsName;"
Rem Run the JavaScript using DoScript.
myFileName = myInDesign.DoScript(myJavaScriptString,
idScriptLanguage.idJavaScript)
If Error.Number = 0 Then
    Rem Place the text file at the end of the text frame.
    myTextFrame.InsertionPoints.Item(-1).Place myFileName
    Error.Clear
End If
Rem Restore normal error handling.
On Error GoTo 0
```

Placing a Graphic

Placing a graphic is like importing a text file. Again, the script displays a dialog box you can use to select the graphic you want to place. When we place the graphic, InDesign returns a reference to the graphic itself, rather than to the frame containing the graphic. To get a reference to the frame, use the `parent` property of the graphic. Once we have that reference, we can apply an object style to the frame. Again, add this script to the end of the script we have been working on.

AppleScript

```
--Display a standard open file dialog box to select a graphic file.
set myGraphicFile to choose file "Choose graphic file."
--If a graphic file was selected, and if you didn't press Cancel,
--place the graphic file on the page.
if myGraphicFile is not "" then
    set myGraphic to place myGraphicFile on page 1 of myDocument
    --Since you can place multiple graphics at once, the place method
    --returns an array. To get the graphic you placed, get the first
    --item in the array.
    set myGraphic to item 1 of myGraphic
    --Create an object style to apply to the graphic frame.
    try
        set myObjectStyle to object style "GraphicFrame" of myDocument on error
        --The object style did not exist, so create it.
        tell myDocument
            set myObjectStyle to make object style with properties
{name:"GraphicFrame"}
            end tell
        end try
        set enable stroke of myObjectStyle to true
        set stroke weight of myObjectStyle to 3
        set stroke type of myObjectStyle to stroke style "Solid" of myDocument
        set stroke color of myObjectStyle to color "Red" of myDocument
        --The frame containing the graphic is the parent of the graphic.
        set myFrame to parent of myGraphic
        tell myFrame to apply object style using myObjectStyle
        --Resize the frame to a specific size.
        set geometric bounds of myFrame to {0, 0, 144, 144}
        --Fit the graphic to the frame proportionally.
        fit myFrame given proportionally
        --Next, fit frame to the resized graphic.
        fit myFrame given frame to content
        set myBounds to geometric bounds of myFrame
        set myGraphicWidth to (item 4 of myBounds) - (item 2 of myBounds)
        --Move the graphic frame.
        set myPageWidth to page width of document preferences of myDocument
        set myMarginPreferences to margin preferences of page 1 of myDocument
        set myTopMargin to top of myMarginPreferences
        move myFrame to {myPageWidth - myGraphicWidth, myTopMargin}
        --Apply a text wrap to the graphic frame.
        set text wrap type of text wrap preferences of myFrame to bounding box
text wrap
        set text wrap offset of text wrap preferences of myFrame to {24, 12, 24,
12}
    end if
end tell
```

JavaScript

```
//Display a standard open file dialog box to select a graphic file.
var myGraphicFile = File.openDialog("Choose a graphic file");
//If a graphic file was selected, and if you didn't press Cancel,
//place the graphic file on the page.
if((myGraphicFile != "")&&(myGraphicFile != null)){
    var myGraphic = myDocument.pages.item(0).place(myGraphicFile);
    //Since you can place multiple graphics at once, the place method
    //returns an array. To get the graphic you placed, get the first
    //item in the array (JavaScript arrays start with item 0).
    myGraphic = myGraphic[0];
    //Create an object style to apply to the graphic frame.
    var myObjectStyle = myDocument.objectStyles.item("GraphicFrame");
    try {
        var myName = myObjectStyle.name;
    }
    catch (myError){
        //The object style did not exist, so create it.
        myObjectStyle = myDocument.objectStyles.add({name:"GraphicFrame"});
    }
    myObjectStyle.enableStroke = true;
    myObjectStyle.strokeWeight = 3;
    myObjectStyle.strokeType = myDocument.strokeStyles.item("Solid");
    myObjectStyle.strokeColor = myDocument.colors.item("Red");
    //The frame containing the graphic is the parent of the graphic.
    var myFrame = myGraphic.parent;
    myFrame.applyObjectStyle(myObjectStyle, true);
    //Resize the frame to a specific size.
    myFrame.geometricBounds = [0,0,144,144];
    //Fit the graphic to the frame proportionally.
    myFrame.fit(FitOptions.proportionally);
    //Next, fit frame to the resized graphic.
    myFrame.fit(FitOptions.frameToContent);
    var myBounds = myFrame.geometricBounds;
    var myGraphicWidth = myBounds[3]-myBounds[1];
    //Move the graphic frame.
    var myPageWidth = myDocument.documentPreferences.pageWidth;
    var myTopMargin = myDocument.pages.item(0).marginPreferences.top;
    myFrame.move([myPageWidth-myGraphicWidth, myTopMargin]);
    //Apply a text wrap to the graphic frame.
    myFrame.textWrapPreferences.textWrapType =
TextWrapTypes.boundingBoxTextWrap;
    myFrame.textWrapPreferences.textWrapOffset = [24, 12, 24, 12];
}
```

VBScript

```
Rem create an object style
On Error Resume Next
Set myObjectStyle = myDocument.ObjectStyles.Item("GraphicFrame")
If Error.Number <> 0 Then
    Set myObjectStyle = myDocument.ObjectStyles.Add
    myObjectStyle.Name = "GraphicFrame"
    Error.Clear
End If
On Error GoTo 0
myObjectStyle.EnableStroke = True
myObjectStyle.StrokeWeight = 3
myObjectStyle.StrokeType = myDocument.StrokeStyles.Item("Solid")
myObjectStyle.StrokeColor = myDocument.Colors.Item("Red")
Rem Again, we'll use a JavaScript to get a file name.
Rem Disable normal error handling.
On Error Resume Next
Rem Create a JavaScript as a string.
myJavaScriptString = "var myTextFile = File.openDialog("Choose a graphic
file");myTextFile.fsName;"
Rem Run the JavaScript using DoScript.
myGraphicFileName = myInDesign.DoScript(myJavaScriptString,
idScriptLanguage.idJavascript)
If Error.Number = 0 Then
    On Error GoTo 0
    Set myGraphic = myDocument.Pages.Item(1).Place(myGraphicFileName)
    Rem Since you can place multiple graphics at once, the place method
    Rem returns an object collection. To get the graphic you placed, get the
first
    Rem item in the collection.
    Set myGraphic = myGraphic.Item(1)
    Rem Create an object style to apply to the graphic frame.
    Rem The frame containing the graphic is the parent of the graphic.
    Set myFrame = myGraphic.Parent
    myFrame.ApplyObjectStyle myObjectStyle, True
    Rem Resize the frame to a specific size.
    myFrame.GeometricBounds = Array(0, 0, 144, 144)
    Rem Fit the graphic to the frame proportionally.
    myFrame.Fit idFitOptions.idProportionally
    Rem Next, fit frame to the resized graphic.
    myFrame.Fit idFitOptions.idFrameToContent
    myBounds = myFrame.GeometricBounds
    myGraphicWidth = myBounds(3) - myBounds(1)
    Rem Move the graphic frame.
    myPageWidth = myDocument.DocumentPreferences.PageWidth
    myTopMargin = myDocument.Pages.Item(1).MarginPreferences.Top
    myFrame.Move Array(myPageWidth - myGraphicWidth, myTopMargin)
    Rem Apply a text wrap to the graphic frame.
    myFrame.TextWrapPreferences.TextWrapType =
idTextWrapTypes.idBoundingBoxTextWrap
    myFrame.TextWrapPreferences.TextWrapOffset = Array(24, 12, 24, 12)
End If
```

Beyond the Basics

At this point, you know how to create a document, set up master page items, enter text, import text, create and apply paragraph styles, create and apply object styles, import graphics, fit graphics to frames, and apply a text wrap. While the document we created is not likely to win any design awards, you have learned the basics of InDesign scripting. In each example, we created objects, set object properties, and used object methods.

For your next step in learning about InDesign scripting, see the *Adobe InDesign CS3 Scripting Guide*. It offers more advanced tutorials on constructing documents, formatting text, finding and changing text, building user interfaces, adding menu items, and working with XML and XML rules.

For more information on InDesign scripting, you also can visit the InDesign Scripting User to User forum, at <http://www.adobeforums.com>. In the forum, scripters can ask questions, post answers, and share their newest scripts. The forum contains hundreds of sample scripts.

You also can find more information on InDesign scripting at the InDesign scripting home page, http://www.adobe.com/products/indesign/xml_scripting.html.
