

# Foundations of Ajax

Ryan Asleson and Nathaniel T. Schutta

# Who Are We?

- Ryan Asleson
- Nathaniel T. Schutta  
[www.ntschutta.com/jat/](http://www.ntschutta.com/jat/)
- First Ajax book!

# The Plan

- Where have we been?
- Where are we now?
- Where are we going?

# How'd we get here?

- It's all about the desktop
  - Very rich applications
  - Upgrades a pain (new hardware anyone?)
- The Web takes center stage
  - Simplified maintenance, low barrier of entry
  - Less functional apps, browser issues
- All about trade offs

# Sorry, that's not how it works

- We conditioned users with thick apps
- Then we took that all away
- Convinced our users to accept thin apps
- The browser pushed us towards plain vanilla
- Applets, Flash, XUL/XAML/XAMJ
- Fundamental Issue - Web is based on a synchronous request/response paradigm

# What is Ajax?

<http://movies.yahoo.com/shop?d=hv&id=1808444810&cf=pg&photoid=521827&intl=us>

A cleaner? A Greek hero?  
A soccer club?

<http://www.v-bal.nl/logos/ajax.jpg>

<http://www.cleansweepsupply.com/pages/skugroup1068.html>

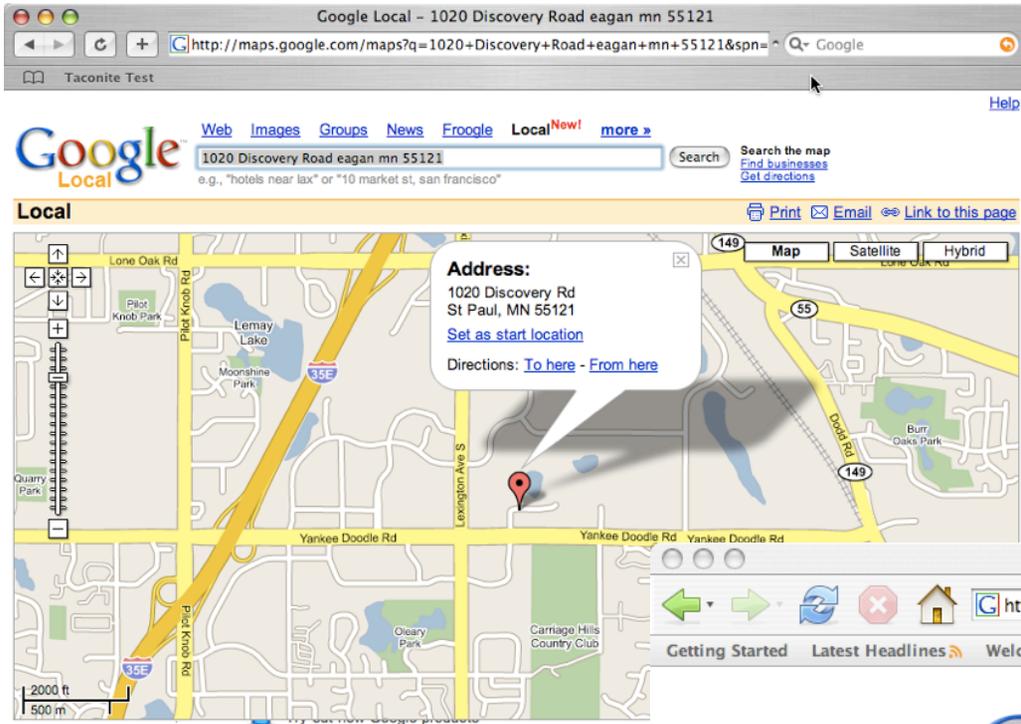

# Give me an 'A'

- Ajax is a catch-phrase - several technologies
- Asynchronous, JavaScript, XML, XHTML, CSS, DOM, **XMLHttpRequest** object
- More of a technique than a specific “thing”
- Communicate with XHR, manipulate the Document Object Model on the browser
- Don't repaint the entire page!
- We gain flexibility

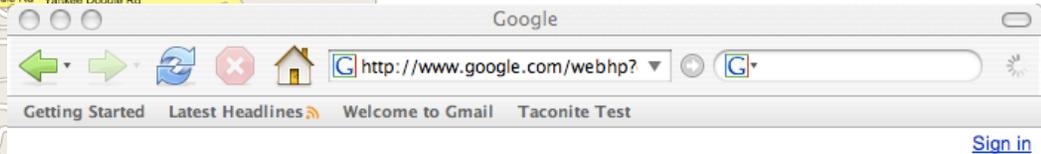

<http://www.adaptivepath.com/publications/essays/archives/000385.php>

# What's old is new again

- XHR was created by Microsoft in IE5
- Of course it only worked in IE
- Early use of JavaScript resulted in pain
- Many developers shunned the language
- XHR was recently adopted by Mozilla 1.0 and Safari 1.2
- And a new generation of web apps was born

Done

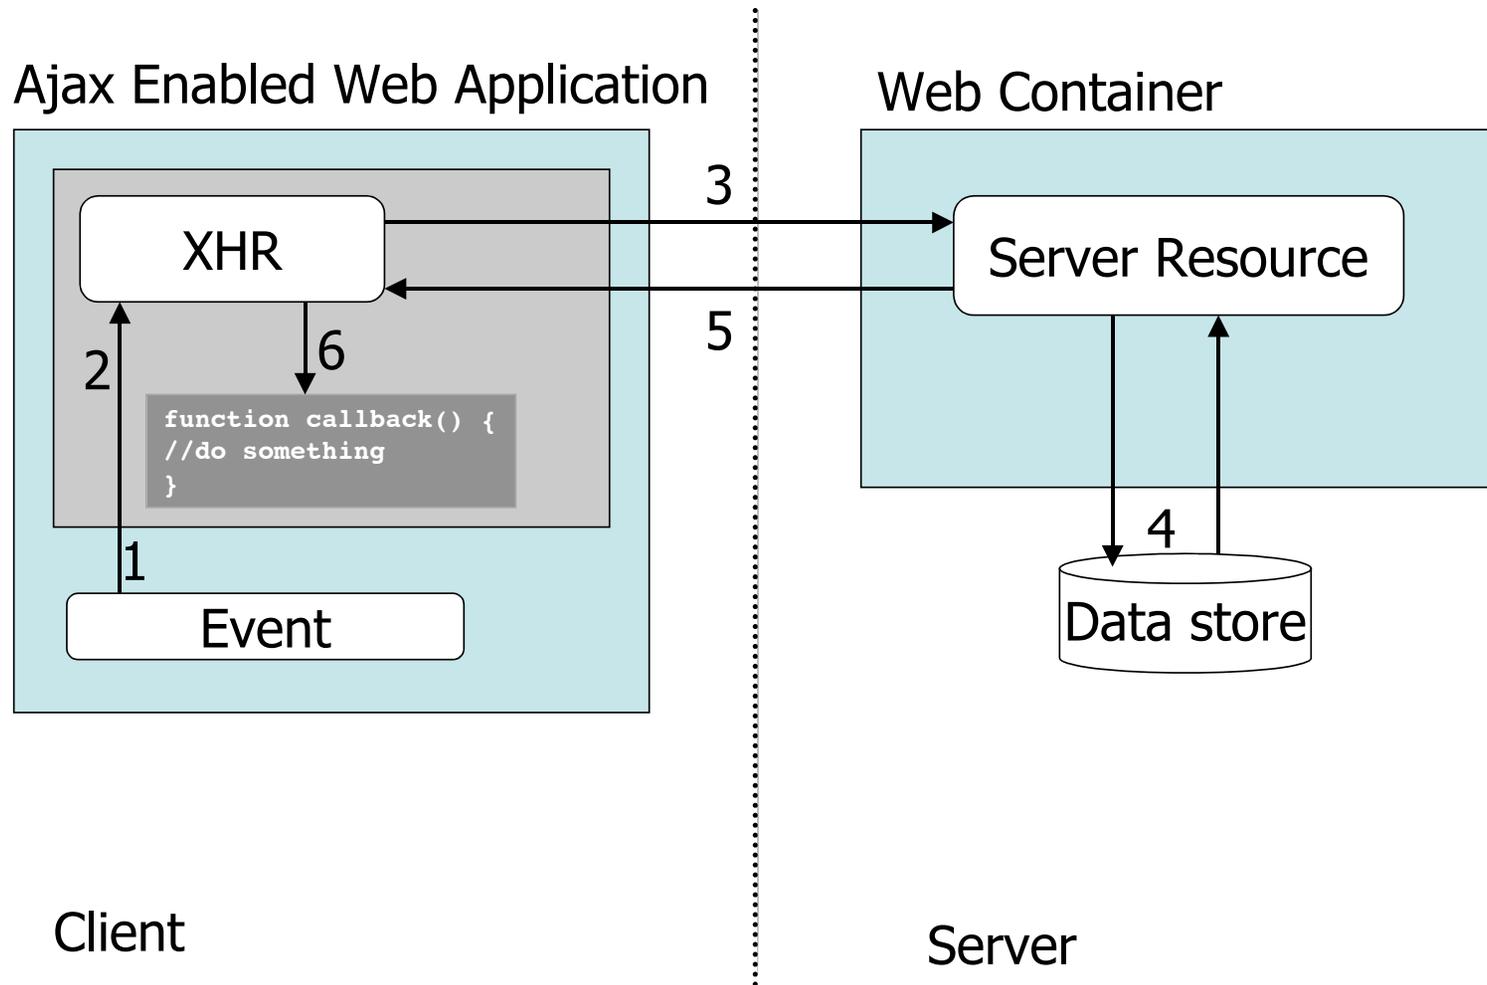

# XHR Methods

Method	Description
<code>open("method", "url" [, async [, "username" [, "password"]]])</code>	Sets the stage for the call - note async flag.
<code>send(content)</code>	Sends the request to the server.
<code>abort()</code>	Stops the request.
<code>getAllResponseHeaders()</code>	Returns all the response headers for the HTTP request as key/value pairs.
<code>getResponseHeader("header")</code>	Returns the string value of the specified header.
<code>setRequestHeader("header", "value")</code>	Sets the specified header to the supplied value.

# XHR Properties

Property	Description
<code>onreadystatechange</code>	The event handler that fires at every state change.
<code>readyState</code>	The state of the request: 0 = uninitialized, 1 = loading, 2 = loaded, 3 = interactive, 4 = complete
<code>responseText</code>	The response from the server as a string.
<code>responseXML</code>	The response from the server as XML.
<code>status</code>	The HTTP status code from the server.
<code>statusText</code>	The text version of the HTTP status code.

# Typical Interaction

# How's this work?

- Start a request in the background
- Callback invokes a JavaScript function - yes prepare yourself for JavaScript
- Can return: a) XML - responseXML, b) HTML - innerHTML c) JavaScript - eval
- Typically results in modifying the DOM
- We are no longer captive to the request/response paradigm!
- But I've done this before...
- IFRAME can accomplish the same concept

# Sample Code

Unfortunately - some browser checking

```
function createXMLHttpRequest() {
    if (window.ActiveXObject) {
        xmlHttp = new ActiveXObject("Microsoft.XMLHTTP");
    }
    elseif(window.XMLHttpRequest) {
        xmlHttp = new XMLHttpRequest();
    }
}
function startRequest() {
    createXMLHttpRequest();
    xmlHttp.onreadystatechange = handleStateChange;
    xmlHttp.open("GET", "simpleResponse.xml");
    xmlHttp.send(null);
}
function handleStateChange() {
    if(xmlHttp.readyState == 4) {
        if(xmlHttp.status == 200) {
            alert("The server replied with: " + xmlHttp.responseText);
        }
    }
}
```

# Spare me the pain

- Yes, JavaScript can hurt
- Tools are coming, for now check out these
- JSDoc (<http://jsdoc.sourceforge.net/>)
- Greasemonkey (<http://greasemonkey.mozdev.org/>)
- Firefox JavaScript Debugger
- Microsoft Script Debugger
- Venkman JavaScript Debugger  
(<http://www.mozilla.org/projects/venkman/>)
- Firefox Extensions
  - Web Developer Extension  
(<http://chrispederick.com/work/webdeveloper/>)

# HTML Validator

The screenshot shows a Mozilla Firefox browser window displaying the source code of a file. The source code includes several HTML tags, some of which are highlighted in blue. A 'Tools' menu is open, showing 'HTML Validator' checked. Below the source code, a panel titled 'HTML errors and warnings' lists several errors and warnings. The selected error is: 'line 43 column 1 - Warning: <noabr> is not approved by W3C'. The 'Help' panel on the right provides a detailed explanation of this error, including the cause and solution.

```
abc
</td>
</table>

<br>-----<br>
<h3 id="test_15">TEST - 15 - inserting implicit ...</h3>
<a href="#test_6">See here</a><br>

<br>-----<br>
<h3 id="test_21">TEST - 21 - ... is not approved by W3C </h3>
BAD:<br>
<noabr>there is no wrapping here</noabr>
<br>

GOOD:<br>
<table><tr><td nowrap>there is no wrapping here</td></tr></table>

GOOD 2:<br>
<span style="white-space: nowrap;">there is no wrapping here</span>
<br>
```

HTML errors and warnings

- line 23 column 11 - Warning: discarding unexpect...
- line 31 column 3 - Warning: missing <tr>
- line 43 column 1 - Warning: <noabr> is not approv...
- line 57 column 1 - Error: <abc> is not recognized!
- line 57 column 1 - Warning: discarding unexpecte...
- line 81 column 2 - Warning: missing <td>
- line 82 column 4 - Warning: discarding unexpecte...
- line 81 column 2 - Warning: missing </form>
- line 83 column 2 - Error: discarding unexpected </...>
- line 106 column 39 - Warning: '<' + ' ' + letter not...

Help

<...> is not approved by W3C

*Cause:*

The following tag is not a standard HTML tag. For most tags, the reason is that there is other ways to achieve the same result with standard tags or with cascaded style sheet.

*Solution:*

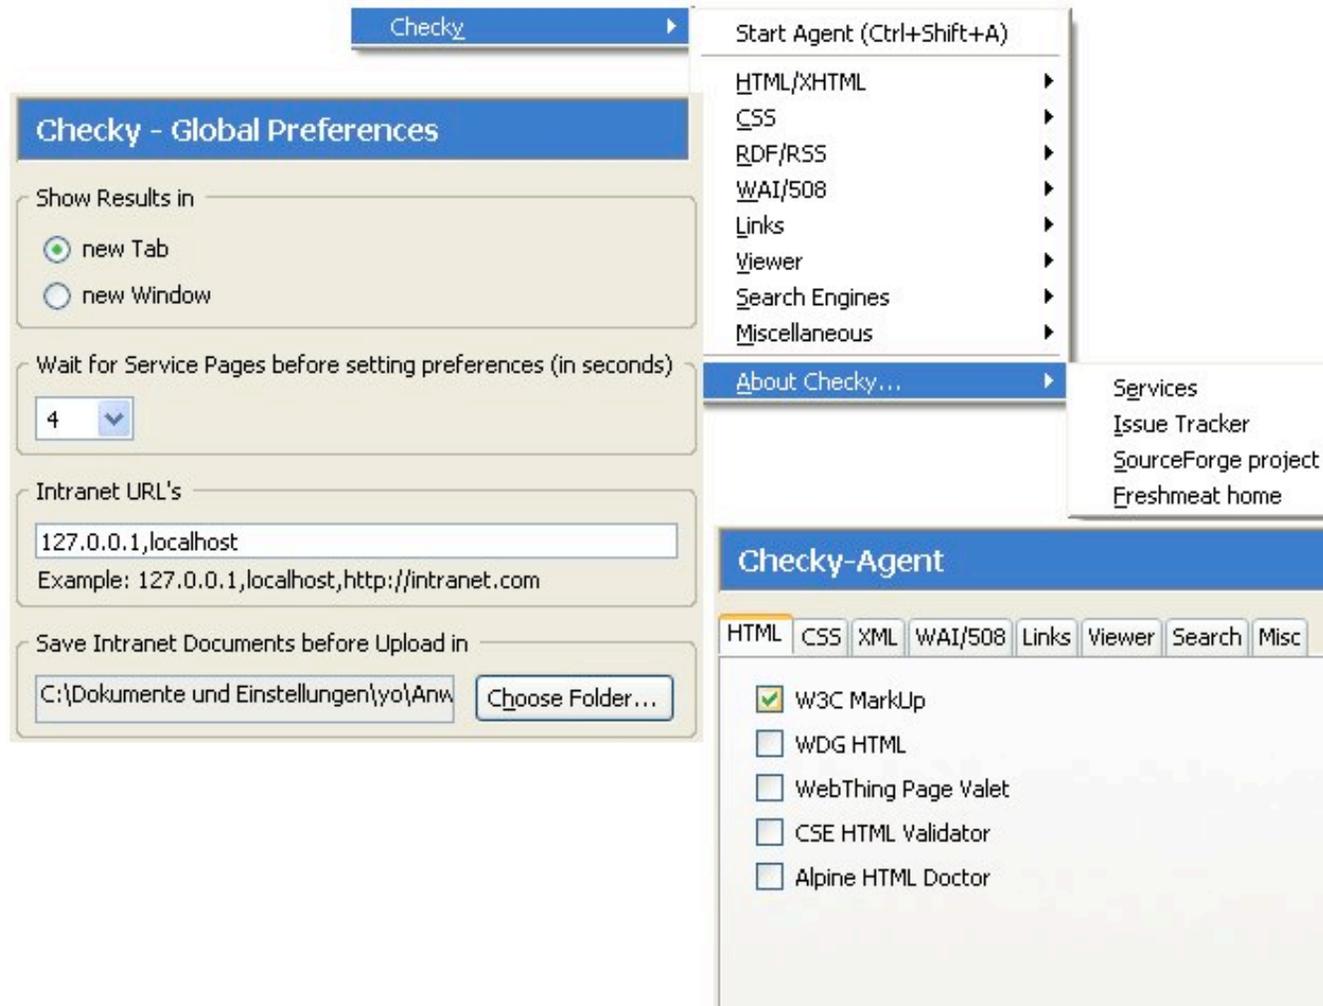

Replace the tag with the equivalent in standard HTML.

# JSLint

The screenshot shows a Microsoft Internet Explorer browser window titled "JSLint, The JavaScript Verifier - Microsoft Internet Explorer". The address bar shows the URL "http://www.crockford.com/javascript/jslint.html". The main content area displays the JSLint logo, a text input field containing JavaScript code for a RemoteRequest function, and a "clear" button. Below the code, there is a status message: "(40) : error at character 25: Use '=' to compare with ''". Underneath is an "Options" section with four checkboxes: "Strict line ending" (checked), "++ and -- considered harmful" (checked), "Tolerate HTML case" (unchecked), and "Tolerate JavaScript deviations" (unchecked). At the bottom, there is another "clear" button and a copyright notice: "Copyright 2002 Douglas Crockford. All Rights Reserved Worldwide".

```
function RemoteRequest() {
  this.xhr = createXMLHttpRequest();
  this.queryString = "";
  this.requestURL = "";
  this.addNamedFormElements = _addNamedFormElements;
  this.addFormElements = _addFormElements;
  this.accumulateQueryString = _accumulateQueryString;
  this.sendRequest = _sendRequest;
  this.setUsePOST = _setUsePOST;
  this.setUseGET = _setUseGET;

  /** Default method to GET for Opera */
  this.method = RemoteRequest.GET;

  /* Pre and Post request function hooks */
  this.preRequest = "";
  this.postRequest = "";
}
```

(40) : error at character 25: Use '=' to compare with ''

Options

- Strict line ending
- ++ and -- considered harmful
- Tolerate HTML case
- Tolerate JavaScript deviations

# JsUnit

The screenshot shows a browser window titled "JsUnit" with the address bar containing "file:///Users/nate/Desktop/jsunit/testRunner.html". The page header includes the JsUnit logo, the title "JsUnit 2.1 TestRunner", and the text "Running on Mozilla/5.0 (Macintosh; U; PPC Mac OS X; en) AppleWebKit/412.6 (KHTML, like Gecko) Safari/412.2". A link for "JsUnit Home" and the email "edward@jsunit.net" is also present.

The main interface prompts the user to "Enter the filename of the Test Page to be run:". Below this, there is a text input field containing "file:/// Choose File jsUnitDeclSetUpTearDownTests.html" and a "Run" button.

Configuration options include a "Trace level" dropdown set to "no tracing", a checked checkbox for "Close old trace window on new run", a "Page load timeout" input set to "20", and a "Setup page timeout" input set to "60".

The status section shows "Status: Done (0.212 seconds)", a "Progress:" bar that is fully filled with green, and summary statistics: "Runs: 2", "Errors: 0", and "Failures: 0".

At the bottom, there is a section for "Errors and failures:" with a vertical scrollbar and two buttons: "Show selected" and "Show all".

# What about libraries?

- There are dozens
- Maturing space
- Most are very new - proceed with caution
- DWR, Dojo, Rico, Microsoft's Atlas, Ruby on Rails, Prototype, etc.
- Taconite

# What's next?

- Better tool support - just a matter of time
- Sun's Creator 2
- Library/toolkit space will consolidate
- User expectation will increase
- More sites will implement

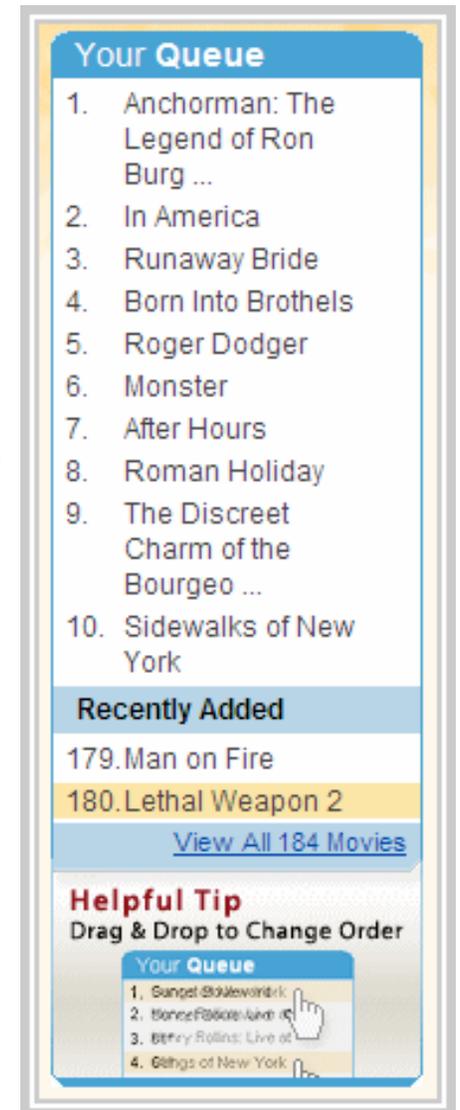

# Now what?

- Start small
- Validation is a good first step
- Auto complete
- More dynamic tool tips
- Partial page updates
- Recalculate
- **It's all about the user!**

# Proceed with caution

- Unlinkable pages - “Link to this page” option
- Broken back button
- Code bloat
- Graceful fallback - older browsers, screen readers
- Breaking established UI conventions
- Lack of visual clues - “Loading” cues
